Part I Just-in-Time Scheduling Systems

1	Scheduling to Maximize the Number of Just-in-Time Jobs: A Survey	3
	Dvir Shabtay and George Steiner	
1.1	Introduction	3
1.2	The <i>JIT</i> Problem on a Single Machine	7
1.2.1	Constant Processing Times	7
1.2.2	Controllable Processing Times	8
1.3	The <i>JIT</i> Scheduling Problem on Parallel Machines	10
1.3.1	Constant Processing Times	10
1.3.2	Controllable Processing Times	12
1.4	The <i>JIT</i> Scheduling Problem in Other Multi-machine Systems	12
1.4.1	Flow Shops	12
1.4.2	Job Shops and Open Shops	17
1.5	Summary	17
	References	19
2	An Exact Algorithm for the Single-Machine Earliness–Tardiness Scheduling Problem	21
	Shunji Tanaka	
2.1	Introduction	21
2.2	Problem Formulation	23
2.2.1	Time-Indexed Formulation	23
2.2.2	Network Representation	24
2.3	Lagrangian Relaxation	26
2.3.1	Lagrangian Relaxation of the Number of Job Occurrences	26
2.3.2	Constraints on Successive Jobs	27
2.3.3	Constraints on Adjacent Pairs of Jobs	29
2.3.4	Constraints on State-Space Modifiers	29

2.4	Network Reduction	30
2.4.1	Network Reduction by Upper Bound	31
2.4.2	Network Reduction by Dominance of Successive Jobs ...	31
2.5	Algorithm Overview	33
2.6	Upper Bound Computation	34
2.6.1	Lagrangian Heuristic	34
2.6.2	Improvement by Neighborhood Search	35
2.6.3	Initial Upper Bound	35
2.7	Numerical Experiments	35
2.8	Conclusion	38
	References	38
3	Single-Machine Scheduling Problems Simultaneous with Deteriorating and Learning Effects Under a Deteriorating Maintenance Consideration	41
	Suh-Jenq Yang and Dar-Li Yang	
3.1	Introduction	41
3.2	Problem Formulation	45
3.3	Problem $1/p_{jr} = (p_j + \lambda t)r^a, ma/\sum_{j=1}^n (\alpha E_j + \beta T_j + \gamma d + \delta D) \dots$	46
3.3.1	Preliminary Analysis	46
3.3.2	Optimal Solutions	52
3.4	Problem $1/p_{jr} = (p_j + \lambda t)r^a, ma/C_{\max}$	58
3.5	Problem $1/p_{jr} = (p_j + \lambda t)r^a, ma/TC$	59
3.6	Problem $1/p_{jr} = (p_j + \lambda t)r^a, ma/TADC$	60
3.7	Conclusions	61
	References	62
4	Scheduling Unrelated Parallel Machines with Sequence Dependent Setup Times and Weighted Earliness–Tardiness Minimization	67
	Eva Vallada and Rubén Ruiz	
4.1	Introduction	67
4.2	Literature Review	70
4.3	Exact Mixed Integer Linear Programming Model	71
4.4	Proposed Methods	74
4.4.1	Representation of Solutions, Initialization of the Population, and Selection Procedure	75
4.4.2	Crossover Operator	76
4.4.3	Local Search	76
4.4.4	Idle Time Insertion	77
4.5	Computational and Statistical Evaluation	79
4.5.1	Testing the Mathematical Models	80
4.5.2	Computational Evaluation for Small Instances	82
4.5.3	Computational Evaluation for Large Instances	83
4.6	Conclusions and Future Research	85
	References	88

5	Mixed-Integer Programming Models for Flowshop Scheduling Problems Minimizing the Total Earliness and Tardiness	91
	Débora P. Ronconi and Ernesto G. Birgin	
5.1	Introduction	91
5.2	MILP Models for Flowshop with Unlimited Buffer	92
5.3	MILP Models for Flowshop with Zero Buffer	97
5.4	Numerical Experiments	101
5.5	Concluding Remarks	103
	References	104
6	Just-in-Time Scheduling with Equal-Size Jobs	107
	Ameur Soukhal and Nguyen Huynh Toung	
6.1	Introduction	107
6.2	Preliminary Results	109
6.2.1	Assignment Problem	111
6.3	Restrictive Common Due Date and Just-in-Time Scheduling	112
6.3.1	$1 p_j = p, d_j = d \sum(\alpha_j E_j + \beta_j T_j)$	112
6.3.2	$1 p_j = p, d_j \in D, D = l, l \text{ fixed} \sum(\alpha_j E_j + \beta_j T_j)$	117
6.3.3	$Qm p_j = p, d_j \in D, D = l, l \text{ fixed} \sum(\alpha_j E_j + \beta_j T_j)$	122
6.4	Non-Restrictive Common Due Date and Just-in-Time Scheduling	122
6.4.1	$Qm p_j = p, d_j = d, \text{non-restrictive} \sum(\alpha_j E_j + \beta_j T_j)$	123
6.4.2	$Qm p_j = p, d_j = d, \text{non-restrictive} \sum(\alpha_j E_j + \beta_j T_j)$	128
6.5	Unknown Common Due Date and Just-in-Time Scheduling	129
6.5.1	Job Assignment Cost Matrix for a Given Due Date	130
6.5.2	$1 p_j = p, d_j = d \text{ unknown} \sum(\alpha_j E_j + \beta_j T_j + \gamma d)$	132
6.5.3	$1 p_j = p, d_j \in D, D \leq l, D \text{ unknown}, l \text{ fixed} \sum(\alpha_j E_j + \beta_j T_j + \gamma_j d_j)$	133
6.5.4	$P p_j = p, d_j \in D, D \leq l, D \text{ unknown}, l \text{ fixed} \sum(\alpha_j E_j + \beta_j T_j + \gamma_j d_j)$	135
6.5.5	Additional Constraint and Not Depending Weights on Jobs	141
6.6	Conclusion	142
	References	143
7	No-Wait Scheduling Problems with Batching Machines	147
	A. Oulamara	
7.1	Introduction	147
7.2	No-Wait Flowshop with Mixed Batching Machines	150
7.2.1	NP-Hardness	150
7.2.2	Equal Processing Times on M_1	153
7.2.3	Equal Processing Times on M_2	156
7.2.4	Approximation	158
7.3	No-Wait Flowshop with Two s-Batching Machines	160
7.3.1	NP-Hardness	160
7.3.2	Integer Programming Formulation	162

7.3.3	Lagrangian Relaxation Heuristic	163
7.3.4	Computational Experiments	165
7.4	Conclusion	167
	References	167

Part II Just-in-Time Philosophy: Interaction with Other Areas

8 Just-in-Time Scheduling in Modern Mass Production

Environment	171	
Joanna Józefowska		
8.1	Introduction	171
8.2	Mathematical Model	173
8.2.1	Basic Model	174
8.2.2	Just-in-Time Scheduling and the Apportionment Problem	175
8.3	Solution Algorithms	177
8.3.1	Minimizing the Total Deviation	178
8.3.2	Minimizing the Maximum Deviation	181
8.4	Multiple Parallel Machines	185
8.4.1	Total Deviation	186
8.4.2	Maximum Deviation	187
8.5	Conclusions	189
References	190

9 Just-in-Time Planning and Lot-Sizing

Nabil Absi, Stéphane Dauzère-Pérès, and Safia Kedad-Sidhoum		
9.1	Introduction	191
9.2	Setup Optimization	194
9.3	Demand Backlogs	197
9.4	Lost Sales and Overtimes	198
9.5	Time Windows Constraints and Early Productions	199
9.6	Bounded Production and Inventory	201
9.7	Dealing with Capacity Constraints	202
9.8	Integrated Lot-Sizing and Scheduling	204
9.9	Conclusion and New Research Directions	204
	References	205

10 Strategic Scheduling Games: Equilibria and Efficiency

Laurent Gourvès, Jérôme Monnot, and Orestis A. Telelis		
10.1	Introduction	209
10.1.1	Contents	212
10.2	Preliminaries and Notation	212
10.2.1	Strategic Games and Equilibria	212
10.2.2	Social Cost-Efficiency of Equilibria	213
10.2.3	Selfish Scheduling and Coordination Mechanisms	216

10.3	An Overview of Coordination Mechanisms	217
10.3.1	Load Balancing: The Makespan Mechanism	217
10.3.2	Ordering Policies	223
10.3.3	Efficiency of SPT and LPT on Identical Machines	226
10.3.4	RANDOM: Randomized Ordering	227
10.3.5	Unrelated Machines Scheduling	228
10.4	Selfish Scheduling and Truthfulness	229
10.4.1	The Model	229
10.4.2	LPT Is Not Truthful	230
10.4.3	SPT and a Matching Lower Bound	230
10.5	Setup Times: A Case Study	231
10.5.1	On the Makespan Mechanism	232
10.6	Type Ordering Mechanisms	235
10.6.1	Pure Nash Equilibria	235
10.6.2	An Optimal Type Ordering Mechanism	237
10.7	Research Directions	241
	References	242
11	Artificial Neural Networks-Based Forecasting: An Attractive Option for Just-in-Time Systems	245
	Mauricio Cabrera-Ríos, María Angélica Salazar-Aguilar, María Guadalupe Villarreal-Marroquín, and Ángela Patricia Anaya Salazar	
11.1	Introduction	245
11.2	Artificial Neural Networks as Forecasting Tools	246
11.3	A General Strategy for Artificial Neural-Networks-Based Forecasting	248
11.4	Case Study 1: Forecasting One Period Ahead	250
11.5	Case Study 2: Forecasting Multiple Periods Simultaneously	255
11.6	Final Thoughts	257
	References	258
12	Just-in-Time Management of a Building Project in the Middle-East	261
	Low Sui Pheng and Thilini Shiromani Jayawickrama	
12.1	Introduction	261
12.2	Key JIT Management Concepts and Principles	262
12.2.1	Elimination of Waste	262
12.2.2	“Kanban” or Pull System	263
12.2.3	Uninterrupted Work Flow	263
12.2.4	Total Quality Control	263
12.2.5	Employee Involvement	264
12.2.6	Supplier Relations	264
12.2.7	Continuous Improvement	265
12.3	Background of the Construction Industry	265
12.4	Characteristics of Case Study Organization	267

12.5	Applications of JIT Principles in Case Study	268
12.5.1	Site Organization	268
12.5.2	Zoning and Construction Teams	268
12.5.3	Construction Managers	268
12.5.4	Site Offices and Other Facilities	268
12.5.5	Elimination of Waste	270
12.5.6	“Kanban” or Pull System	277
12.5.7	Uninterrupted Work Flow	278
12.5.8	Total Quality Control	281
12.5.9	Employee Involvement	281
12.5.10	Supplier Relations	282
12.5.11	Continuous Improvement	283
12.6	Findings and Conclusion	283
12.7	Recommendations	284
	References	285
13	Analysis of Transient Throughput Rates of Transfer Lines with Pull Systems	287
	Mahmut Ali Gökçe, M. Cemali Dinçer, and M. Arslan Örnek	
13.1	Introduction	288
13.2	Literature Review	290
13.3	Approach and the Model	292
13.3.1	The Atomic Pull Model	293
13.4	Experiments and Numerical Results	296
13.5	Conclusions and Future Research	300
