

Contents

1	Maxwell's Equations	1
1.1	Introduction	1
1.2	Gradient, Curl and Divergence	2
1.3	Integral Theorems for the Case of \mathbb{R}^3	7
1.4	Maxwell's Equations in Integral Form	11
1.4.1	The Law of Induction	11
1.4.2	Gauss' Law	13
1.4.3	The Law of Biot and Savart	15
1.4.4	The Lorentz Force	17
1.4.5	The Continuity Equation	18
1.5	Maxwell's Equations in Local Form	21
1.5.1	Induction Law and Gauss' Law	22
1.5.2	Local Form of the Law of Biot and Savart	23
1.5.3	Local Equations in All Systems of Units	24
1.5.4	The Question of Physical Units	25
1.5.5	Equations of Electromagnetism in SI System	28
1.5.6	The Gaussian System of Units	29
1.6	Scalar Potentials and Vector Potentials	35
1.6.1	A Few Formulae from Vector Analysis	35
1.6.2	Construction of a Vector Field from Its Source and Its Curl	40
1.6.3	Scalar Potentials and Vector Potentials	42
1.7	Phenomenology of the Maxwell Equations	46
1.7.1	The Fundamental Equations and Their Interpretation	47
1.7.2	Relation Between Displacement Field and Electric Field	50
1.7.3	Relation Between Induction and Magnetic Fields	52
1.8	Static Electric States	55
1.8.1	Poisson and Laplace Equations	56

1.8.2	Surface Charges, Dipoles and Dipole Layers	62
1.8.3	Typical Boundary Value Problems	66
1.8.4	Multipole Expansion of Potentials	69
1.9	Stationary Currents and Static Magnetic States	83
1.9.1	Poisson Equation and Vector Potential	84
1.9.2	Magnetic Dipole Density and Magnetic Moment	84
1.9.3	Fields of Magnetic and Electric Dipoles	88
1.9.4	Energy and Energy Density	92
1.9.5	Currents and Conductivity	95
2	Symmetries and Covariance of the Maxwell Equations	97
2.1	Introduction	97
2.2	The Maxwell Equations in a Fixed Frame of Reference	97
2.2.1	Rotations and Discrete Spacetime Transformations	98
2.2.2	Maxwell's Equations and Exterior Forms	102
2.3	Lorentz Covariance of Maxwell's Equations	119
2.3.1	Poincaré and Lorentz Groups	120
2.3.2	Relativistic Kinematics and Dynamics	123
2.3.3	Lorentz Force and Field Strength	126
2.3.4	Covariance of Maxwell's Equations	128
2.3.5	Gauge Invariance and Potentials	132
2.4	Fields of a Uniformly Moving Point Charge	136
2.5	Lorentz Invariant Exterior Forms and the Maxwell Equations	141
2.5.1	Field Strength Tensor and Lorentz Force	142
2.5.2	Differential Equations for the Two-Forms ω_F and $\omega_{\mathcal{F}}$	145
2.5.3	Potentials and Gauge Transformations	148
2.5.4	Behaviour Under the Discrete Transformations	149
2.5.5	* Covariant Derivative and Structure Equation	150
3	Maxwell Theory as a Classical Field Theory	153
3.1	Introduction	153
3.2	Lagrangian Function and Symmetries in Finite Systems	153
3.2.1	Noether's Theorem with Strict Invariance	155
3.2.2	Generalized Theorem of Noether	156
3.3	Lagrangian Density and Equations of Motion for a Field Theory	157
3.4	Lagrangian Density for Maxwell Fields with Sources	163
3.5	Symmetries and Noether Invariants	168
3.5.1	Invariance Under One-Parameter Groups	169
3.5.2	Gauge Transformations and Lagrangian Density	171
3.5.3	Invariance Under Translations	175
3.5.4	Interpretation of the Conservation Laws	179
3.6	Wave Equation and Green Functions	183
3.6.1	Solutions in Noncovariant Form	183
3.6.2	Solutions of the Wave Equation in Covariant Form	188

3.7	Radiation of an Accelerated Charge	193
4	Simple Applications of Maxwell Theory	199
4.1	Introduction	199
4.2	Plane Waves in a Vacuum and in Homogeneous Insulating Media	199
4.2.1	Dispersion Relation and Harmonic Solutions	199
4.2.2	Completely Polarized Electromagnetic Waves	205
4.2.3	Description of Polarization	209
4.3	Simple Radiating Sources	213
4.3.1	Typical Dimensions of Radiating Sources	214
4.3.2	Description by Means of Multipole Radiation	216
4.3.3	The Hertzian Dipole	220
4.4	Refraction of Harmonic Waves	225
4.4.1	Index of Refraction and Angular Relations	225
4.4.2	Dynamics of Refraction and Reflection	227
4.5	Geometric Optics, Lenses and Negative Index of Refraction	232
4.5.1	Optical Signals in Coordinate and in Momentum Space	232
4.5.2	Geometric (Ray) Optics and Thin Lenses	236
4.5.3	Media with Negative Index of Refraction	240
4.5.4	Metamaterials with Negative Index of Refraction	247
4.6	The Approximation of Paraxial Beams	249
4.6.1	Helmholtz Equation in Paraxial Approximation	249
4.6.2	The Gaussian Solution	250
4.6.3	Analysis of the Gaussian Solution	252
4.6.4	Further Properties of the Gaussian Beam	256
5	Local Gauge Theories	261
5.1	Introduction	261
5.2	Klein–Gordon Equation and Massive Photons	261
5.3	The Building Blocks of Maxwell Theory	265
5.4	Non-Abelian Gauge Theories	269
5.4.1	The Structure Group and Its Lie Algebra	269
5.4.2	Globally Invariant Lagrange Densities	276
5.4.3	The Gauge Group	277
5.4.4	Potential and Covariant Derivative	278
5.4.5	Field Strength Tensor and Curvature	282
5.4.6	Gauge-Invariant Lagrange Densities	284
5.4.7	Physical Interpretation	288
5.4.8	*More on the Gauge Group	290
5.5	The U(2) Theory of Electroweak Interactions	295
5.5.1	A U(2) Gauge Theory with Massless Gauge Fields	295
5.5.2	Spontaneous Symmetry Breaking	297
5.5.3	Application to the U(2) Theory	303

5.6	Epilogue and Perspectives	307
6	Classical Field Theory of Gravitation	309
6.1	Introduction	309
6.2	Phenomenology of Gravitational Interactions	310
6.2.1	Parameters and Orders of Magnitude	310
6.2.2	Equivalence Principle and Universality	312
6.2.3	Red Shift and Other Effects of Gravitation	316
6.2.4	Some Conjectures and Further Program	322
6.3	Matter and Nongravitational Fields	322
6.4	Spacetimes as Smooth Manifolds	325
6.4.1	Manifolds, Curves, and Vector Fields	325
6.4.2	One-Forms, Tensors, and Tensor Fields	332
6.4.3	Coordinate Expressions and Tensor Calculus	335
6.5	Parallel Transport and Connection	343
6.5.1	Metric, Scalar Product, and Index	343
6.5.2	Connection and Covariant Derivative	345
6.5.3	Torsion and Curvature Tensor Fields	349
6.5.4	The Levi-Civita Connection	351
6.5.5	Properties of the Levi-Civita Connection	353
6.5.6	Geodesics on Semi-Riemannian Spacetimes	356
6.5.7	More Properties of the Curvature Tensor	360
6.6	The Einstein Equations	363
6.6.1	Energy-Momentum Tensor Field in Curved Spacetime	363
6.6.2	Ricci Tensor, Scalar Curvature, and Einstein Tensor	364
6.6.3	The Basic Equations	366
6.7	Gravitational Field of a Spherically Symmetric Mass Distribution	371
6.7.1	The Schwarzschild Metric	372
6.7.2	Two Observable Effects	374
6.7.3	The Schwarzschild Radius is an Event Horizon	382
6.8	Some Concluding Remarks	385
	Bibliography	387
	Some Historical Remarks	389
	Exercises	395
	Selected Solutions of the Exercises	403
	Index	429
	About the Author	433

Classical Field Theory

On Electrodynamics, Non-Abelian Gauge Theories and
Gravitation

Scheck, F.

2012, XII, 436 p., Hardcover

ISBN: 978-3-642-27984-3
