Preface	v
List of Notation	xvii
List of Algorithms	xix
1 Geometric Brownian Motion and the Efficient Market Hypothesis	1
1.1 Stock Prices as a Random Walk	1
1.2 Brownian Motion	3
1.3 Wiener Processes	7
1.3.1 Simulating Brownian Motion End Points	8
1.3.2 Simulating Brownian Motion Paths	9
1.3.3 Wiener Processes with Drift	9
1.4 Arithmetical Random Walk	9
1.5 Geometric Brownian Motion	10
1.5.1 Price Volatility	10
1.5.2 Geometric Brownian Motion End Point Distribution	12
1.6 Binomial Lattice Approximation	17
1.6.1 Binomial Pricing Model	17
1.6.2 Calculating the Binomial Factors	18
1.7 Efficient Market Hypothesis	21
1.7.1 Simple Moving Average	22
1.7.2 Exponential Moving Average	24
1.7.3 Testing the EMH	25
1.7.4 Testing an Advanced Indicator	27
Problems: Chapter 1	29
2 Return and Risk	33
2.1 The Risk-Free Rate	34
2.2 Fixed-Income Securities Calculations	35
2.2.1 Simple Interest	35

2.2.2	Compounding	36
2.2.3	Discounting	40
2.3	Risk for a Single Investment	43
2.3.1	The Solution by Simulation	45
2.3.2	The Effect of Dividends	46
2.3.3	Stocks Follow the Market	47
2.3.4	Correlated Stock Prices	49
2.4	Risk for Two Investments	53
2.5	Value at Risk	55
2.5.1	Historical Simulation Method	57
2.6	Mean-Variance Portfolio Theory	59
2.6.1	A Two Scenario Example	60
2.6.2	Portfolio Risk	64
2.6.3	Efficient Frontier	66
2.7	Capital Asset Pricing Model	68
2.7.1	The Market Portfolio	69
2.7.2	Beta Factor of a Portfolio	71
2.7.3	The Security Market Line	73
	Problems: Chapter 2	74
3	Forward and Option Contracts and Their Pricing	77
3.1	Option Payoff Diagrams	78
3.1.1	Call Options	79
3.2	Basic Assumptions	80
3.2.1	Replication Principle	81
3.2.2	Put-Call Parity	82
3.3	Forward Contracts	82
3.3.1	Pricing an Investment Forward Contract	82
3.3.2	Forward Contracts on a Stock Awarding Dividends	84
3.3.3	Valuing a Forward Contract	86
3.4	Option Pricing: Binomial Lattice Model	87
3.4.1	Pricing for a One-Step Binomial Tree	87
3.4.2	Pricing for a Multi-step Binomial Lattice	91
3.5	Pricing Put and Call Options Over Non-dividend Paying Stocks by the Binomial Method	93
3.5.1	Extension to an n -Step Lattice	93
3.5.2	Risk-Neutral Binomial Pricing of Options	94
3.5.3	Node-by-Node Binomial Option Pricing	96
3.5.4	American Options	98
3.6	Option Pricing: Integrating the Lognormal	100
3.6.1	Black-Scholes Pricing Formula	100
3.6.2	Probability the Option Ends ITM	102
3.6.3	Interpretation of d_1 and d_2	103
3.6.4	Implied Volatility	104
3.6.5	Option Prices for Dividend Paying Stocks	105

3.7	The Monte Carlo Method for Option Pricing	106
3.7.1	European Options	107
3.7.2	The Monte Carlo Method for American Options	109
	Problems: Chapter 3	114
4	Pricing Exotic Options	117
4.1	Asian Options	118
4.1.1	Floating Strike Asian Option	120
4.2	Barrier Options	120
4.3	Basket Options	122
4.4	Exchange Options	124
4.4.1	Non-constant Correlation	125
4.5	Bermudan Options	126
4.5.1	The Binomial Tree Method	127
4.5.2	The Exercise Boundary Method	127
4.6	Shout Options	129
4.6.1	Maximizing Over a Shout Boundary	129
	Problems: Chapter 4	133
5	Option Trading Strategies	135
5.1	Related Option Trades	135
5.1.1	Reverse Trades	136
5.1.2	Dual Trades	136
5.2	The Greeks	137
5.2.1	Delta (Δ), the Derivative with Respect to S	138
5.2.2	Gamma (Γ), the Second Derivative with Respect to S ...	140
5.2.3	Theta (Θ), the Derivative with Respect to τ	142
5.2.4	Vega (ν), the Derivative with Respect to σ	144
5.2.5	Rho (ρ), the Derivative with Respect to r	146
5.3	Setting Stops: Maximum Variables	146
5.4	Some Popular Option Trades	148
5.4.1	Buying Puts and Calls	150
5.4.2	Selling Naked Puts and Calls	152
5.4.3	Covered Calls and Protective Puts	152
5.4.4	Debit Spreads	154
5.4.5	Credit Spreads	155
5.4.6	Calendar Spreads	156
5.4.7	Straddles	158
5.4.8	Butterflies	159
5.4.9	Iron Condors	161
	Problems: Chapter 5	163
6	Alternatives to GBM Prices	165
6.1	Martingale Measures	166
6.2	Incomplete Markets	167
6.2.1	Pricing in an Incomplete Market	169

6.3	Lévy Processes	169
6.3.1	The Poisson Process	170
6.3.2	The Inverse Gaussian Process	172
6.4	Lévy Measures	173
6.5	Jump-Diffusion Processes	175
6.6	Application to Asset Pricing	177
6.6.1	Merton's Model	177
6.6.2	Jump-Diffusion Risk-Free Growth	179
6.6.3	Calculating Prices for Vanilla Options	180
6.7	Time Shifted Processes	182
6.8	Heavytailed Distributions	183
6.8.1	Student's t-Distribution	184
6.8.2	Difference Subordinator Densities	186
	Problems: Chapter 6	187
7	Kelly's Criterion	191
7.1	Kelly's Formula for a Simple Game	192
7.2	The Simple Game with Catastrophic Loss	195
7.3	The Optimal Allocation Problem When Only One Winner	196
7.3.1	A Four Choice Allocation Problem	197
7.3.2	A Two Choice Problem with $\tau \leq 1$	198
7.3.3	A Two Choice Problem with $\tau > 1$	199
7.3.4	Solution to the Four Choice Problem	199
7.4	The Optimal Allocation Problem with Multiple Winners	202
7.4.1	Allocation for Correlated Investments	203
7.5	Taming the Kelly Volatility	207
	Problems: Chapter 7	210
A	Some Mathematical Background Topics	213
A.1	Series Identities	213
A.1.1	Geometric Series	213
A.1.2	Arithmetic Series	213
A.1.3	Taylor's Series	213
A.2	Histograms	214
A.3	Probability Distributions and Densities	214
A.4	Expectations	215
A.5	The Normal Distribution	216
A.6	The Central Limit Theorem	217
A.7	Least Squares	217
A.8	Error Estimates for Monte Carlo Simulations	218
A.9	Drawing Normal Samples	220
A.10	Drawing Inverse Gaussian Samples	221
A.11	Inverting the CDF	221
A.12	Cramer's Rule	222
A.13	LaGrange Optimization	222
A.14	Bisection Method for Roots	223

B	Stochastic Calculus	225
B.1	The Itô Integral	225
B.2	Itô's Lemma	227
B.3	Black-Scholes Differential Equation	229
C	Convergence of the Binomial Method	231
D	Variance Reduction Techniques	233
D.1	Antithetic Sampling	233
D.2	Control Variates	234
D.3	Importance Sampling	235
E	Shell Sort	237
F	NextDayPrices Program	239
	References	245
	Index	247

Finance with Monte Carlo

Shonkwiler, R.W.

2013, XIX, 250 p. 70 illus., 17 illus. in color., Hardcover

ISBN: 978-1-4614-8510-0
