Introduction	vii
1 Quasi-metric and Quasi-uniform Spaces	
1.1 Topological properties of quasi-metric and quasi-uniform spaces	2
1.1.1 Quasi-metric spaces and asymmetric normed spaces	2
1.1.2 The topology of a quasi-semimetric space	4
1.1.3 More on bitopological spaces	14
1.1.4 Compactness in bitopological spaces	21
1.1.5 Topological properties of asymmetric seminormed spaces	25
1.1.6 Quasi-uniform spaces	30
1.1.7 Asymmetric locally convex spaces	36
1.2 Completeness and compactness in quasi-metric and quasi-uniform spaces	45
1.2.1 Various notions of completeness for quasi-metric spaces	45
1.2.2 Compactness, total boundedness and precompactness	60
1.2.3 Baire category	71
1.2.4 Baire category in bitopological spaces	73
1.2.5 Completeness and compactness in quasi-uniform spaces	77
1.2.6 Completions of quasi-metric and quasi-uniform spaces	92
2 Asymmetric Functional Analysis	
2.1 Continuous linear operators between asymmetric normed spaces	99
2.1.1 The asymmetric norm of a continuous linear operator	100
2.1.2 Continuous linear functionals on an asymmetric seminormed space	103
2.1.3 Continuous linear mappings between asymmetric locally convex spaces	106
2.1.4 Completeness properties of the normed cone of continuous linear operators	110
2.1.5 The bicompletion of an asymmetric normed space	112
2.1.6 Asymmetric topologies on normed lattices	114
2.2 Hahn-Banach type theorems and the separation of convex sets	124

2.2.1	Hahn-Banach type theorems	124
2.2.2	The Minkowski gauge functional – definition and properties	128
2.2.3	The separation of convex sets	129
2.2.4	Extreme points and the Krein-Milman theorem	131
2.3	The fundamental principles	134
2.3.1	The Open Mapping and the Closed Graph Theorems	134
2.3.2	The Banach-Steinhaus principle	137
2.3.3	Normed cones	139
2.4	Weak topologies	142
2.4.1	The w^b -topology of the dual space X_p^b	142
2.4.2	Compact subsets of asymmetric normed spaces	144
2.4.3	Compact sets in LCS	145
2.4.4	The conjugate operator, precompact operators and a Schauder type theorem	151
2.4.5	The bidual space, reflexivity and Goldstine theorem	155
2.4.6	Weak topologies on asymmetric LCS	161
2.4.7	Asymmetric moduli of rotundity and smoothness	165
2.5	Applications to best approximation	170
2.5.1	Characterizations of nearest points in convex sets and duality	171
2.5.2	The distance to a hyperplane	177
2.5.3	Best approximation by elements of sets with convex complement	179
2.5.4	Optimal points	181
2.5.5	Sign-sensitive approximation in spaces of continuous or integrable functions	181
2.6	Spaces of semi-Lipschitz functions	183
2.6.1	Semi-Lipschitz functions – definition and the extension property	183
2.6.2	Properties of the cone of semi-Lipschitz functions – linearity	187
2.6.3	Completeness properties of the spaces of semi-Lipschitz functions	190
2.6.4	Applications to best approximation in quasi-metric spaces	199
	Bibliography	201
	Index	215

Functional Analysis in Asymmetric Normed Spaces

Cobzas, S.

2013, X, 219 p. 1 illus. in color., Softcover

ISBN: 978-3-0348-0477-6

A product of Birkhäuser Basel
