Contents

Part I Processes with Lumped Parameters

1 Linear Processes Invariant in Time 3
1.1 The State Equations for Linear Processes Invariant in Time 3
1.2 The Complete Taylor Series 4
1.3 The Taylor Series with Odd Derivatives 4
1.4 The Taylor Series with Even Derivatives. 5
1.5 The Complete Taylor Series-LIL 6
1.6 The Taylor Series-LIL with Odd Derivatives 7
1.7 The Taylor Series-LIL with Even Derivatives 8
1.8 The Non Iterative Variant of Calculus of the Taylor Series . . . 9
1.9 The Starting of Calculus for the Taylor Series with Odd and Even Derivatives 10

2 Time-Varying Linear Processes 11
2.1 The State Equations for Linear Processes Varying in Time . . . 11
2.2 The Complete Taylor Series 11
2.3 The Taylor Series with Odd Derivatives 12
2.4 The Taylor Series with Even Derivatives. 12
2.5 The Complete Taylor Series-LIL 13
2.6 The Taylor Series-LIL with Odd Derivatives 13
2.7 The Taylor Series-LIL with Even Derivatives 14
2.8 The Non-iterative Variant of Calculus of the Taylor Series . . . 15

3 Nonlinear Processes with Lumped Parameters 17
3.1 The State Equations for Nonlinear Processes 17
3.2 The Complete Taylor Series-LIL 18
3.3 The Taylor Series-LIL with Odd Derivatives 19
3.4 The Taylor Series-LIL with Even Derivatives 20

Part II Processes with Distributed Parameters

4 Linear Processes with Distributed Parameters 25
4.1 Partial Derivative Equations. 25
4.2 State Variables, Initial Conditions and Final Conditions 26
4.3 The Complete Method of the Taylor Series for the Approximation of the Vector ($\mathbf{x}_k$): The Definition of the Matrix M_{pdx} 28
4.4 The Taylor Series with Odd Derivatives for the Approximation of the Vector ($\mathbf{x}_k$). 33
4.5 The Taylor Series with Even Derivatives for the Approximation of the Vector ($\mathbf{x}_k$). 34
4.6 The Method of the Complete Taylor Series-LIL for the Approximation of the Vector ($\mathbf{x}_k$). 36
4.7 References on the Initial and Starting Conditions, Associated with the Matrix M_{pdx} 39

5 Nonlinear Processes with Distributed Parameters 45

6 Truncated Errors of the Operator Matrix $\mathbf{M_{pdx}}$. 51
6.1 Partial Derivatives Equations 51
6.2 Pivot Element ($x_{n,\ 0\ldots0}$) of the Matrix M_{pdx} 58
6.2.1 PDE I.2, with the Pivot Element (x_{10}). 58
6.2.2 PDE I.3, with the Pivot Element (x_{100}) 58
6.2.3 PDE I.4, with the Pivot Element (x_{1000}) 59
6.2.4 PDE II.2, with the Pivot Element $x_{20,}$ in the Complete Variant 59
6.2.5 PDE II.3, with the Pivot Element $x_{200,}$ in the Complete Version 59
6.2.6 PDE II.4, with the Pivot Element $x_{2000,}$ in the Complete Version 60
6.2.7 PDE III.2, with the Pivot Element $x_{30,}$ in the Complete Variant 60
6.2.8 PDE IV.2, with the Pivot Element $x_{40,}$ in the Complete Version 61
6.2.9 PDE II.2, with the Pivot Element $x_{20,}$ in the Incomplete Version 62
6.3 Conclusions 63

Part III Simulation Examples

7 Modeling and Simulation Examples for Lumped Parameters Processes

7.1 Simplified Control System 67
7.2 Complete Control System 69
7.3 Time Varying Linear Process 72
7.4 Nonlinear Process, Defined by the Van der pol Equation 74
7.5 Nonlinear Process Defined by the Düffing Equation 75
7.6 Nonlinear Process Defined by the Riccati Equation 76
7.7 Nonlinear Process with Feedback 77
7.8 Case for Modeling-Simulation of the Asynchronous Motor, Supplied with Variable Frequency Voltage 79

8 Modeling: Simulation Examples for Distributed Parameters Processes 83
8.1 The Performance Indicator of Numerical Integration. 83
8.2 Control System of a Process, Modeled by PDE II.2 104
8.3 Control System of a Process, Modeled by PDE II.3 110
8.4 System of Two PDE II.2 120
8.5 Comparison Between the Numerical Integration of a ODE II Through Taylor Series and Taylor Series-LIL . . . 125
8.6 Comparison Between the Numerical Integration of a PDE II.2 Through Taylor Series and Taylor Series-LIL. 129
8.7 PDE of the IVth Order with Four Variables. 130

9 Case Studies for Establishing the M_{pdx} Matrix 135
9.1 Control System with PDE II.4 and PID Controller 135
9.1.1 Preliminaries 135
9.1.2 Establishing the M_{pdx} Matrix 139
9.1.3 Initial Conditions 143
9.1.4 The Calculus of x_T and x_{TPQR} 145
9.2 Control System with PDE II.3 and PID Controller 146
9.2.1 The Approached Problem 146
9.2.2 Establishing the Matrix M_{pdx} 150
9.2.3 Initial Conditions 153
9.2.4 The Calculus of x_T and x_{TPQR} 155
9.3 Control System with PDE II.2 and PID Controller 156
9.3.1 Preliminaries 156
9.3.2 Establishing the Matrix M_{pdx} 159
9.3.3 Initial Conditions 163
9.3.4 The Calculus of x_T and x_{TP} 164
9.4 Remarks 166

10 Partial Derivative Equations in the Cartesian Space 167
10.1 An Approximation Variant for $y_{0000}(t, p, q, r)$ 167
10.2 Forms for $F_{0P}(p)$, $F_{0Q}(q)$, $F_{0R}(r)$, and $F_{0S}(s)$ [SR 22.24(25)] 170
10.2.1 Polynomial Forms of the 3rd Order 170
10.2.2 Gaussian Function, Modified [SR22.32 (33)] 171
10.2.3 Multiple Exponential Forms [SR 22.28(29)] 172
10.3 The Time Function $F_{0T}(t)$ 175
10.4 The Coefficient (K_y) 176
10.5 The Analogical Modeling and Numerical Simulation for PDE (t, s) 176
10.6 Truncation Errors in the Numerical Simulation for PDE (t, s) 187
10.7 Preliminaries Regarding the Introduction in Control Loops of Processes Modeled Through (PDE) 191
10.7.1 The Control Loop 191
10.7.2 The Analogical Modeling Through (M_{pdx}), Variant I 192
10.7.3 The Analogical Modeling Through (M_{pdx}), Variant II 193
10.7.4 Numerical Simulation Through M_{pdx} and Taylor Series 195
10.8 Conclusions 197

11 Parallel, Serial and with Feed-Back Connections, for the Processes Modeled Through PDE 199
11.1 The Components of the Interconnection Systems 199
11.1.1 Referring to the F_{00A} (t, s_A) and F_{00B} (t, s_B) Functions 204
11.2 PDE Connected in Parallel 208
11.2.1 Components of M_{pdxA} and M_{pdxB} for the Parallel Connection 209
11.2.2 The Results Obtained by Parallel Connection 209
11.3 PDE Connected in Series 214
11.3.1 Components of M_{pdxA} and M_{pdxB} for the Serial Connection 215
11.3.2 The Results Obtained for the Serial Connection 215
11.4 PDE with Feed-Back Connection 219
11.4.1 Components of M_{pdxA} and M_{pdxB} for the Feed-Back Connection 220
11.4.2 The Results Obtained for the Feed-Back Connection 225
11.5 Conclusions 227

12 Control Systems with Distributed and Lumped Parameters in the Cartesian Space: Cases Studies 231
12.1 The General Control Structure 231
12.2 The Analogical Modeling Through M_{pdx} 233
12.3 The Numerical Simulation Through (M_{pdx}) and Taylor Series 239
12.4 Case Study 1: The Control of a Propagation Process 241
12.4.1 The Control Space 241
12.4.2 Structure Parameters Within the System 241
12.4.3 The Behavior of the Technologic Process PDE II.2 in Open Loop. 243
12.4.4 The Behavior of the Technologic Process PDE II.2 in Control Loop 245
12.5 Case Study 2. The Control of Railway Traction with a Diesel Engine. 248
12.5.1 The Analogical Modeling of the Diesel Engine Through M_{pdx} 248
12.5.2 The Analogical Modeling of the Diesel Engine Through M_{pdx}, Included in a Railway Traction Structure, with the Control of the Speed of the Train 254
12.5.3 The Numerical Simulation Through M_{pdx} and Taylor Series 264
12.5.4 The Results Obtained by Software [Programs SR22.50(51); SR22.52(53); SR22.54(55)] 266
12.6 Conclusions 274

13 Numerical Simulation Using Partial Differential Equations, for Propagation and Control in Discontinuous Structures Processes 283
13.1 The Propagation in Successive Zones 283
13.2 The Propagation Parameters. 283
13.3 Formal Aspects of the Discontinuous Propagation 285
13.4 The Analogical Model of the Proposed Control Scheme 287
13.5 The Numerical Simulation Through M_{pdx} and Taylor Series 289
13.6 Case Studies Simulated on the Computer 291
13.6.1 Determination of the Propagation Parameters. 291
13.6.2 The Propagation Process in Open Circuit 293
13.6.3 The Propagation Process with Stabilizing Control . . . 294
13.7 Conclusions 297

14 Conclusions 299

Appendix A1: Summary for M_{pdx} matrix 303

Appendix A2: Local-Iterative Linearization Method 319

Appendix A3: Regarding the Convergence of the Local-Iterative Linearization Method 329
