1	Introduction	1
1.1	Mathematical Modelling	1
1.2	Partial Differential Equations	2
1.3	Well Posed Problems	5
1.4	Basic Notations and Facts	7
1.5	Integration by Parts Formulas	10
1.6	Abstract Methods and Variational Formulation	11
1.7	Numerical approximation methods	12

Part I Differential Models

2	Scalar Conservation Laws	17
2.1	Introduction	17
2.2	Linear transport equation	20
2.2.1	Distributed source	21
2.2.2	Extinction and localized source	22
2.2.3	Inflow and outflow characteristics. A stability estimate	24
2.3	Traffic Dynamics	26
2.3.1	A macroscopic model	26
2.3.2	The method of characteristics	28
2.3.3	The green light problem. Rarefaction waves	30
2.3.4	Traffic jam ahead. Shock waves. Rankine–Hugoniot condition	34
2.4	The method of characteristics revisited	37
2.5	Generalized solutions. Uniqueness and entropy condition	40
2.6	The Vanishing Viscosity Method	44

2.6.1	The viscous Burgers' equation	48
2.7	Numerical methods	51
2.7.1	Finite difference approximation of scalar conservation laws	51
2.8	Exercises	53
2.8.1	Numerical approximation of a constant coefficient scalar conservation law	55
2.8.2	Numerical approximation of Burgers equation	57
2.8.3	Numerical approximation of traffic dynamics	57
3	Diffusion	59
3.1	The Diffusion Equation	59
3.1.1	Introduction	59
3.1.2	The conduction of heat	60
3.1.3	Well posed problems ($n = 1$)	62
3.1.4	A solution by separation of variables	65
3.1.5	Problems in dimension $n > 1$	73
3.2	Uniqueness	76
3.2.1	Integral method	76
3.2.2	Maximum principles	78
3.3	The Fundamental Solution	81
3.3.1	Invariant transformations	81
3.3.2	Fundamental solution ($n = 1$)	83
3.3.3	The Dirac distribution	85
3.3.4	Pollution in a channel. Diffusion, drift and reaction	88
3.3.5	Fundamental solution ($n > 1$)	89
3.4	The Global Cauchy Problem ($n = 1$)	90
3.4.1	The homogeneous case	90
3.4.2	Existence of a solution	91
3.4.3	The non homogeneous case. Duhamel's method ...	92
3.5	An example of Nonlinear diffusion. The porous medium equation	95
3.6	Numerical methods	99
3.6.1	Finite difference approximation of the heat equation	99
3.6.2	Stability analysis for Euler methods	101
3.6.3	The solution of the heat equation as a probability density function	102
3.7	Exercises	104
3.7.1	Application of Euler methods to the discretization of the Cauchy-Dirichlet problem	106
3.7.2	Application to the dynamics of chemicals	107

4	The Laplace Equation	109
4.1	Introduction	109
4.2	Well Posed Problems. Uniqueness	110
4.3	Harmonic Functions	112
4.3.1	Mean value properties	112
4.3.2	Maximum principles	114
4.3.3	The Dirichlet problem in a circle. Poisson's formula	116
4.4	Fundamental Solution and Newtonian Potential	120
4.4.1	The fundamental solution	120
4.4.2	The Newtonian potential	122
4.5	The Green Function	123
4.5.1	An integral identity	123
4.5.2	The Green function for the Dirichlet problem	125
4.5.3	Green's representation formula	127
4.5.4	The Neumann function	129
4.6	Numerical methods	130
4.6.1	The 5 point finite difference scheme for the Poisson problem	130
4.7	Exercises	134
4.7.1	Approximation of an elastic membrane using the 5 point scheme	136
4.7.2	Numerical simulations for testing maximum principles	137
5	Reaction-diffusion models	139
5.1	Reaction Models	139
5.1.1	The mass action law	139
5.1.2	Inhibition, activation	142
5.2	Diffusion and linear reaction	145
5.2.1	Pure diffusion. Asymptotic behavior	145
5.2.2	Asymptotic behavior in general domains	148
5.2.3	Linear reaction. Critical dimension	151
5.2.4	Linear reaction and diffusion in two dimensions	153
5.2.5	An Example in dimension $n = 3$	155
5.3	Diffusion and nonlinear reaction	160
5.3.1	Monotone methods	160
5.3.2	The Fisher's equation	163
5.3.3	Steady states, linearization and stability	165
5.3.4	Application to Fisher's equation (Dirichlet conditions)	168

5.3.5	Application to Fisher's equation (Neumann conditions)	173
5.4	Turing instability	175
5.5	Numerical methods	181
5.5.1	Numerical approximation of a nonlinear reaction-diffusion problem	181
5.6	Exercises	182
5.6.1	Numerical simulation of Fisher's equations	183
5.6.2	Numerical approximation of travelling wave solutions	185
5.6.3	Numerical approximation of Turing instability and pattern formation	186
6	Waves and vibrations	189
6.1	General Concepts	189
6.1.1	Types of waves	189
6.1.2	Group velocity and dispersion relation	191
6.2	Transversal Waves in a String	193
6.2.1	The model	193
6.2.2	Energy	195
6.3	The One-dimensional Wave Equation	196
6.3.1	Initial and boundary conditions	196
6.4	The d'Alembert Formula	198
6.4.1	The homogeneous equation	198
6.4.2	The nonhomogeneous equation. Duhamel's method	202
6.4.3	Dissipation and dispersion	203
6.5	Second Order Linear Equations	205
6.5.1	Classification	205
6.5.2	Characteristics and canonical form	208
6.6	The Multi-dimensional Wave Equation ($n > 1$)	213
6.6.1	Special solutions	213
6.6.2	Well posed problems. Uniqueness	215
6.6.3	Small vibrations of an elastic membrane.	217
6.6.4	Small amplitude sound waves	221
6.7	The Cauchy Problem	225
6.7.1	Fundamental solution ($n = 3$) and strong Huygens' principle	225
6.7.2	The Kirchhoff formula	228
6.7.3	Cauchy problem in dimension 2	229
6.7.4	Non homogeneous equation. Retarded potentials	231

6.8	Numerical methods	232
6.8.1	Numerical approximation of the one-dimensional wave equation	232
6.9	Exercises	234
6.9.1	Numerical simulation of a vibrating string	236
6.9.2	Numerical simulation of a vibrating membrane	238

Part II Functional Analysis Techniques for Differential Problems

7	Elements of Functional Analysis	243
7.1	Lebesgue Measure and Integral	244
7.1.1	A counting problem	244
7.1.2	Measures and measurable functions	245
7.1.3	The Lebesgue integral	247
7.1.4	Some fundamental theorems	248
7.2	Hilbert Spaces	249
7.2.1	Normed spaces	250
7.2.2	Inner product and Hilbert Spaces	254
7.2.3	Projections	258
7.2.4	Orthonormal bases	263
7.3	Linear Operators and Duality	267
7.3.1	Linear operators	267
7.3.2	Functionals and dual space	270
7.4	Abstract Variational Problems	273
7.4.1	Bilinear forms and the Lax-Milgram Theorem	273
7.4.2	Minimization of quadratic functionals	277
7.4.3	Approximation and Galerkin method	278
7.5	Distributions and Functions	281
7.5.1	Preliminary concepts	281
7.5.2	Test functions	283
7.5.3	Distributions	284
7.5.4	Calculus	286
7.6	Sobolev Spaces	293
7.6.1	The space $H^1(\Omega)$	293
7.6.2	The spaces $H_0^1(\Omega)$ and $H_T^1(\Omega)$	296
7.6.3	The dual of $H_0^1(\Omega)$	298
7.6.4	The spaces $H^m(\Omega)$ and $H_0^m(\Omega)$, $m > 1$	300
7.6.5	Calculus rules	301
7.7	Exercises	302

8	Variational formulation of elliptic problems	307
8.1	Elliptic Equations	307
8.2	The Poisson Problem	309
8.3	Diffusion, Drift and Reaction ($n = 1$)	311
8.3.1	The problem	311
8.3.2	Dirichlet conditions	311
8.3.3	Neumann conditions	315
8.3.4	Robin and mixed conditions	318
8.4	Variational Formulation of Poisson's Problem	320
8.4.1	The Dirichlet problem	320
8.4.2	Neumann, Robin and mixed problems	322
8.5	Eigenvalues of the Laplace operator	325
8.5.1	Separation of variables revisited	325
8.5.2	An asymptotic stability result	328
8.6	Equations in Divergence Form	330
8.6.1	Basic assumptions	330
8.6.2	Dirichlet problem	330
8.6.3	Neumann problem	333
8.6.4	Robin and mixed problems	335
8.7	A Control Problem	336
8.7.1	Structure of the problem	336
8.7.2	Existence and uniqueness of an optimal pair	337
8.7.3	Lagrange multipliers and optimality conditions	339
8.8	Numerical methods	342
8.8.1	The finite element method in one space dimension	342
8.8.2	Error analysis of the finite element method	344
8.8.3	The finite element method for the approximation of advection, diffusion, reaction problems	346
8.8.4	The finite element method in two space dimensions	348
8.9	Exercises	350
8.9.1	Approximation of boundary conditions in the finite element method	353
8.9.2	Approximation of Robin boundary conditions	354
8.9.3	Approximation of a system of equations	355
8.9.4	Effect of problem regularity on the convergence of the finite element method	356
9	Weak formulation of evolution problems	359
9.1	Parabolic Equations	359
9.2	The Heat Equation	360
9.2.1	The Cauchy-Dirichlet problem	360

9.2.2	Galerkin approximations	363
9.2.3	Energy estimates	366
9.2.4	Existence and stability	368
9.2.5	Neumann and mixed boundary conditions	370
9.3	General Equations	374
9.3.1	Weak formulation of initial-boundary value problems	374
9.4	Numerical methods	381
9.4.1	A Faedo-Galerkin/finite element method for the heat equation	381
9.5	Exercises	383
9.5.1	Verification of Euler methods stability properties ..	385
9.5.2	Numerical simulation of mass transfer	385

Part III Solutions

10	Solutions of selected exercises	389
10.1	Section 2.8	389
10.2	Section 3.7	398
10.3	Section 4.7	410
10.4	Section 5.6	418
10.5	Section 6.9	420
10.6	Section 7.7	426
10.7	Section 8.9	433
10.8	Section 9.5	441

Part IV Appendices

A	Fourier Series	449
A.1	Fourier coefficients	449
A.2	Expansion in Fourier series	452
B	Notes on ordinary differential equations	455
B.1	Bidimensional autonomous systems	455
B.2	Linear systems	458
B.3	Non-linear systems	463
C	Finite difference approximation of time dependent problems	467
C.1	Discrete scheme and the equivalence principle	468

D Identities and Formulas	471
D.1 Gradient, Divergence, Curl, Laplacian	471
D.2 Formulas	473
References	475
Index	479

A Primer on PDEs

Models, Methods, Simulations

Salsa, S.; Vegni, F.; Zaretti, A.; Zunino, P.

2013, XIV, 489 p., Softcover
