

Contents

1 Tradition and Innovation: The Case of the Eighteenth and Nineteenth Century Wooden Bridges	1
1.1 The Beginning of a New Path	1
1.1.1 The Need for a Rational Criterion	2
1.1.2 The Quest for a Proper Ratio	4
1.2 Alphabetically Ordered Knowledge	7
1.2.1 The Encyclopédie ou Dictionnaire Raisonné des Sciences, des Arts et des Métiers	8
1.3 Load Bearing Capacity of a Wood Element According to Proportions	12
1.4 From Beam to Arch: The École des Ponts et Chaussées Concours des Ponts	14
1.5 Jean Grubenmann: A New Idea of Wooden Arch	19
1.6 Karl Friedrick von Wiebeking: “A New Way to Build Wooden Bridges”	26
References	30
2 Theory and Tests on Wood Elements in the Nineteenth Century in Architecture and Engineering French Treatises	33
2.1 Wood Strength: First Tests	33
2.2 The Heritage of Mathematics	34
2.3 Theory Tested by Experience	38
2.4 Experimental Basis of Structural Mechanics	41
2.5 The Proposal for a Rigorous Approach	47
2.6 Load-Based Element Dimensioning	51
2.7 A Rigorous Scientific Formula Made Easy	54
References	59
3 The Application of Structural Mechanics to Wooden Bridge Design: First Attempts	61
3.1 Cost Effectiveness, Strength and Durability of Town’s System	61

3.2	The Evolution of Town's System	66
3.3	First French Structural Analysis of Wooden Bridge According to Navier's Bending Theory	73
3.3.1	Load Bearing Capacity of a Temporary Bridge in Lyon	74
3.3.2	Load Bearing Capacity of a Temporary Bridge in Lozanne.	77
3.3.3	Load Test of the Vaudreuil Bridge	79
	References	83
Index		85

Toward Structural Mechanics Through Wooden Bridges
in France (1716-1841)

Tardini, C.

2014, XV, 87 p. 48 illus., Softcover

ISBN: 978-3-319-00286-6
