

Contents

1	Introduction	1
1.1	Nonlinearity in Materials	1
1.2	Three Fragments from the History of the Nonlinear Theory of Waves	3
1.2.1	Riemann Simple Waves: Transition from Linear Plane Waves to Nonlinear Ones	4
1.2.2	Earnshaw's Solution of the Basic Equations of Hydrodynamics: The Oldest Example of Using the Successive Approximations Method	9
1.2.3	To Nonlinear Waves in Optics	11
1.3	Structure of Book	15
1.3.1	Audience	15
1.3.2	Five Basic Parts of the Book	16
1.3.3	Detailed Structure of Book	16
	Exercises	22
	References	22
2	Preliminary Information About Waves and Materials	25
2.1	About Waves	25
2.1.1	Observations and Definitions	25
2.1.2	Classifications of Waves	27
2.1.3	From History of Studying the Waves	28
2.2	About Materials	30
2.2.1	General Definitions and Classifications	30
2.2.2	On Structural Mechanics of Materials	32
2.2.3	A Few Words on Nanotechnology and Nanomechanics of Materials	35
2.2.4	To Structural Nanomechanics of Composite Materials	37
	Exercises	39
	References	40

3 Elastic Materials	45
3.1 Basic Concepts in the Nonlinear Theory of Elasticity	45
3.1.1 Basic Concepts: Body, Motion, Configuration, Vector of Displacements	45
3.1.2 Basic Notions: Strain Tensors, Invariants, Christoffel Symbols	48
3.1.3 Basic Notions: Forces, Moments, Stress Tensors	51
3.1.4 Basic Notions: Balance Laws	53
3.2 Nonlinear Elastic Isotropic Materials: Three Types of Elastic Materials	56
3.2.1 Nonlinear Elastic Isotropic Materials: Generally Elastic Materials	56
3.2.2 Nonlinear Elastic Isotropic Materials: Hypoelastic Materials	60
3.2.3 Nonlinear Elastic Isotropic Materials; Hyperelastic Materials: Seth and Signorini Potentials; Treloar, Mooney, Rivlin–Saunders models; John Harmonic Material	61
3.2.4 Nonlinear Elastic Isotropic Materials: Hyperelastic Materials (Cubic Potentials and Murnaghan Potential, and Its Variants)	65
Exercises	75
References	75
4 The Simplest Linear Waves in Elastic Materials	79
4.1 Classical Linear Waves in the Theory of Elasticity	79
4.1.1 Basic Equations: Volume and Shear Waves	79
4.1.2 Classical Wave Equation: Basic Facts	81
4.1.3 Classical Wave Equation: Waves as the Result of Breaking the Correctness	84
4.1.4 Classical Wave Equation: Basic Characteristics and Terminology	86
4.1.5 Classical Wave Equation: Plane Waves	90
4.1.6 Classical Wave Equation: Cylindrical Waves	95
4.2 Classical Linear Waves in the Theory of Elastic Mixtures	97
4.2.1 Some Known Microstructural Theories of Materials	97
4.2.2 Basic Equations: Volume and Shear Waves in Mixtures	107
4.2.3 Classical Wave Equation: Plane Waves in Mixtures	109
Exercises	116
References	117

5 Nonlinear Plane Longitudinal Waves in Elastic Materials (Murnaghan Model, Five-Constant Model)	121
5.1 Quadratically Nonlinear Elastic Plane Longitudinal Waves	122
5.1.1 Quadratically Nonlinear Wave Equations Describing Plane Waves	122
5.1.2 Method of Successive Approximations as Applied to Studying Plane Hyperelastic Harmonic Waves	124
5.1.3 Numerical Modeling as an Addendum to the Previous Subsection	132
5.1.4 Problem on Triplets of Quadratically Nonlinear Elastic Plane Polarized Waves	142
5.1.5 Method of Slowly Varying Amplitudes as Applied to the Study of Plane Hyperelastic Harmonic Longitudinal Waves	147
5.1.6 Method of Slowly Varying Amplitudes. Self-Switching of Two Longitudinal Elastic Harmonic Plane Waves	151
5.2 Cubically Nonlinear Elastic Plane Longitudinal Waves	161
5.2.1 Basic Nonlinear Wave Equations	161
5.2.2 Generation of New Harmonics by Longitudinal Plane Cubically Nonlinear Elastic Harmonic Wave (First Standard Problem)	164
5.2.3 Influence of Third Harmonics Progress on Evolution of Longitudinal Plane Elastic Wave Profile	166
Exercises	171
References	172
6 Nonlinear Plane Longitudinal Waves in Elastic Materials (John Model, Two-Constant Model and Signorini Model, Three-Constant Model)	175
6.1 Nonlinear Plane Longitudinal Elastic Harmonic Waves (John Model, Two-Constant Model, Geometrically Nonlinear Only Model)	176
6.1.1 Quadratically Nonlinear Elastic Plane Longitudinal Waves	176
6.1.2 Cubically Nonlinear Elastic Plane Longitudinal Waves	179
6.2 Nonlinear Plane Longitudinal Elastic Harmonic Waves (Signorini Model—Three-Constant Model)	182
6.2.1 Utility of Universal Deformations in an Analysis of Signorini Nonlinear Model	182
6.2.2 Transition from Murnaghan-Based Nonlinear Wave Equations to Signorini-Based Nonlinear Wave Equations	188
6.2.3 Longitudinal Nonlinear Waves in the Signorini Model	194
Exercises	195
References	196

7	Nonlinear Plane Transverse Waves in Elastic Materials (Murnaghan Model, Five-Constant Model)	199
7.1	Quadratically Nonlinear Elastic Plane Transverse Waves	199
7.1.1	Quadratically Nonlinear Wave Equations Describing Plane Transverse Waves	199
7.1.2	Method of Successive Approximations as Applied to Studying Plane Transverse Elastic Harmonic Waves: Second Standard Problem (First Two Approximations)	200
7.1.3	Method of Successive Approximations as Applied to Studying Plane Transverse Elastic Harmonic Waves: Third Standard Problem (First Two Approximations)	202
7.2	Cubically Nonlinear Elastic Plane Transverse Waves	203
7.2.1	Cubically Nonlinear Wave Equations	203
7.2.2	Two Nonlinear Elastic Harmonic Plane Transverse Vertical Waves (Analysis by Method of Slowly Varying Amplitudes, Case of Two Distinguishing Waves)	204
	Exercises	210
	References	210
8	Nonlinear Plane Waves in Hypoelastic Materials	213
8.1	Necessary Facts from the Theory of Hypoelastic Materials	213
8.1.1	Introduction	213
8.1.2	Basic Notions	214
8.1.3	Necessary Information on Elastic Plane Waves	216
8.2	Hypoelastic Materials. Linearization. Cases of Presence of Initial Stresses and Velocities	219
8.2.1	Linearization of Constitutive Equations	219
8.2.2	Hypoelastic Materials: Linearized Constitutive Equations (Case 1)	220
8.2.3	Hypoelastic Materials: Linearized Constitutive Equations (Case 2)	221
8.3	Hypoelastic Materials: Plane Waves in the Presence of Initial Stresses	222
8.3.1	Plane Waves in the Presence of Initial Stresses: General Approach	222
8.3.2	Plane Waves in Presence of Initial Stresses. Initially Isotropic Material	227
	Exercises	229
	References	229
9	Nonlinear Plane Waves in Elastic Mixtures (Elastic Composite Materials)	231
9.1	Nonlinear Wave Equations for Elastic Two-Component Mixtures (Elastic Two-Component Composite Materials)	232

9.1.1	Basic Equations for Elastic Two-Component Mixtures (Isotropic Elastic Two-Component Composite Materials)	232
9.1.2	Basic Equations for Elastic Two-Component Mixtures (Orthotropic Elastic Two-Component Composite Materials)	235
9.2	Nonlinear Longitudinal Plane Waves in Elastic Two-Component Mixtures	239
9.2.1	First Standard Problem (First Two Approximations) . . .	239
9.2.2	Nonlinear Longitudinal Plane Wave: General Scheme for Determination of Critical Time and Critical Distance	245
9.2.3	Nonlinear Harmonic Longitudinal Plane Wave (Mode) in Elastic Mixtures	249
9.3	Nonlinear Plane Polarized Waves in Elastic Mixtures: Wave Triplets	251
9.3.1	Wave Triplets in Elastic Mixtures: Graphical Method of Analysis with Aim of Dispersion Curves	251
9.3.2	Graphical Method of Analysis with Aim of Dispersion Curves: Two Classical Experiments on Dispersion in Elastic Mixtures	254
9.3.3	Wave Triplets in Elastic Mixtures: Noncollinear Waves	258
9.3.4	Interaction of Many Plane Waves in Elastic Mixtures: Method of Slowly Varying Amplitudes	264
9.4	Nonlinear Plane Transverse Waves in Elastic Mixtures	287
9.4.1	Second Standard Problem: Two First Approximations (Interaction Between Modes)	287
9.4.2	The Third Standard Problem: New Superimposed Waves	292
	Exercises	299
	References	300
10	Nonlinear Cylindrical and Torsional Waves in Hyperelastic Materials	303
10.1	Nonlinear Wave Equations for Cylindrical and Torsional Waves: Four Different Configurations	304
10.1.1	Four Different Configurations (States): Displacements and Strains	304
10.1.2	Four Different States: Murnaghan Potential (Stresses) . . .	309
10.1.3	Four Different States: Nonlinear Wave Equations	318
10.1.4	Four Different States: Nonlinear Wave Equations in Displacements	321

10.2	Quadratically Nonlinear Cylindrical Waves	326
10.2.1	Method of Successive Approximations: First Two Approximations (First Way of Solving)	326
10.2.2	Method of Successive Approximations: First Two Approximations (Second Way of Solving)	331
10.2.3	Method of Successive Approximations: First Two Approximations (Examples of Numerical Analysis of Evolution)	336
10.2.4	Comparison of Some Results for Cylindrical and Plane Waves, Propagating in Materials Modeled by Murnaghan Potential	339
10.2.5	Cylindrical Waves Propagating in Materials Modeled by Signorini Potential	351
10.3	Quadratically Nonlinear Torsional Waves	357
10.3.1	Quadratically Nonlinear Torsional Waves in Isotropic Materials	357
10.3.2	Quadratically Nonlinear Torsional Waves in Transversally Isotropic Materials	367
	Exercises	377
	References	378
11	Nonlinear Rayleigh and Love Surface Waves in Elastic Materials	381
11.1	Nonlinear Elastic Rayleigh Surface Waves: General Statement. Nonlinear Wave Equations	382
11.1.1	Elastic Surface Waves	382
11.1.2	Linear Elastic Rayleigh Surface Waves. Basic Moments	383
11.1.3	Nonlinear Elastic Rayleigh Surface Waves. General Information Basic Equations	388
11.2	Nonlinear Elastic Rayleigh Surface Waves: Solving the Nonlinear Wave Equations. First Two Approximations	393
11.3	Nonlinear Elastic Rayleigh Surface Waves: Analysis of Nonlinear Boundary Conditions	401
11.3.1	Boundary Conditions for Cases of Small and Large Strains	401
11.3.2	Analysis of Boundary Conditions. New Nonlinear Rayleigh Equation	405
11.4	Nonlinear Elastic Love Surface Waves. General Statement. Nonlinear Wave Equations	409
11.4.1	Linear Elastic Love Waves	409
11.4.2	Nonlinear Elastic Love Surface Waves: Nonlinear Wave Equations	414

11.4.3	Nonlinear Elastic Love Surface Waves: Solving the Nonlinear Wave Equations	417
11.4.4	Nonlinear Elastic Love Surface Waves: Analysis of Nonlinear Boundary Conditions	420
	Exercises	425
