

Preface

The proceedings of the fifth edition of ADHOCNETS (International Conference on Ad Hoc Networks) deals with all aspects of ad hoc networks. These cover a variety of paradigms in a broad range of applications, commercial and military, such as mobile ad hoc networks, sensor networks, vehicular networks, underwater networks, underground networks, personal area networks, home networks, and large-scale metropolitan networks for smart cities.

A major outcome of this edition would be to provide researchers and designers with a better understanding of real-world challenges for converging ad hoc networks technologies and to enable them to develop innovative viable solutions to address such challenges. We also hope to be able to identify critical issues that require further investigations and analysis. Papers included in these proceedings cover a range of topics that include wireless sensor networks, routing, security, and applications.
