

# Contents

<b>1</b>	<b>General Laws of the Electromagnetic Field</b>	<b>1</b>
1.1	Maxwell's Equations	1
1.2	Energy Transported by the Electric Field	2
1.3	Momentum Transported by the Electromagnetic Field	3
1.4	Electromagnetic Potentials	5
1.5	Gauge Invariance	6
1.6	Solving Maxwell's Equations in Vacuum	8
1.7	Radiation Pressure	11
1.8	Sinusoidal Plane Waves	12
<b>2</b>	<b>Spectrum and Polarisation</b>	<b>15</b>
2.1	Spectrum of the Radiation	15
2.2	Spectra of Some Particular Pulse Shapes	19
2.3	Spectra of Stochastic and Periodic Signals	21
2.4	Diffraction Grating Spectroscope	25
2.5	Polarisation of a Monochromatic Wave	30
2.6	Spectropolarimetric Measurements	34
2.7	Properties of the Stokes Parameters	38
<b>3</b>	<b>Radiation from Moving Charges</b>	<b>41</b>
3.1	Electromagnetic Potentials Due to Charges and Currents	41
3.2	The Liénard and Wiechart Potentials	46
3.3	The Electromagnetic Field of a Moving Charge	49
3.4	Radiation from a Moving Charge	53
3.5	Thomson Scattering	58
3.6	Rayleigh Scattering	60
3.7	Bremsstrahlung	61
3.8	Cyclotron Radiation	68
3.9	Synchrotron Radiation	70
3.10	Multipolar Expansion in the Radiation Zone	76
3.11	Radiation Diagram for the Multipolar Components	80

<b>4</b>	<b>Quantisation of the Electromagnetic Field</b>	85
4.1	Harmonic Oscillator, Operators of Creation and Annihilation	85
4.2	Expansion of the Electromagnetic Field in Fourier Series	89
4.3	The Quantum Analog	92
4.4	Intensity and Photons	96
<b>5</b>	<b>Relativistic Wave Equations</b>	99
5.1	The Dirac Equation for a Free Particle	99
5.2	The Dirac Equation for the Electron in an Electromagnetic Field	104
5.3	Nonrelativistic Limit of the Dirac Equation	106
5.4	Zero Order Limit, Pauli Equation	107
5.5	First Order Limit	110
5.6	The Dirac Equation Describes a Particle of Spin $1/2$	112
5.7	Solution of the Dirac Equation in a Magnetic Field	115
<b>6</b>	<b>Atoms with a Single Valence Electron</b>	119
6.1	Hydrogen Atom, Bohr Theory	119
6.2	Schrödinger's Equation in Spherical Coordinates	126
6.3	Hydrogen Atom, Quantum Theory	133
6.4	Hydrogen Atom, Relativistic Corrections	137
6.5	Spectra of Alkaline Metals	143
<b>7</b>	<b>Atoms with Multiple Valence Electrons</b>	149
7.1	The Pauli Exclusion Principle	149
7.2	The Nonrelativistic Hamiltonian: Good Quantum Numbers	152
7.3	The Central Field Approximation	155
7.4	The Thomas-Fermi Method	156
7.5	The Variational Method and the Hartree-Fock Method	159
7.6	Configurations	163
7.7	The Principle of Formation of the Periodic Table	166
7.8	Configurations of Excited Electrons	168
7.9	A Summary of Angular Momentum Theory	171
7.10	Terms Originating from Given Configurations	177
7.11	The Eigenfunctions of the Non-relativistic Hamiltonian	183
7.12	The Helium Atom	186
7.13	The Carbon Atom	189
<b>8</b>	<b>Term Energies</b>	191
8.1	The Diagonal Sum Rule	191
8.2	Calculation of Diagonal Matrix Elements	195
8.3	Single Particle Matrix Elements	198
8.4	Matrix Elements of the Coulomb Interaction	199
8.5	Sums over Closed Subshells	202
8.6	Terms Structure	204

<b>9</b>	<b>More Details on Atomic Spectra</b>	207
9.1	The Spin-Orbit Interaction	207
9.2	The Wigner-Eckart Theorem and the Projection Theorem	210
9.3	The Landé Interval Rule	213
9.4	The j-j Coupling and the Intermediate Coupling	218
9.5	The Zeeman Effect (Classical Approach)	220
9.6	The Zeeman Effect (Quantum Approach)	222
9.7	The Paschen-Back Effect	227
9.8	Hyperfine Structure, Isotope Effect	230
9.9	Hyperfine Structure, Effect Due to the Nuclear Spin	233
<b>10</b>	<b>Laws of Thermodynamic Equilibrium</b>	237
10.1	The Principles of Statistical Equilibrium	237
10.2	Maxwell's Velocity Distribution	240
10.3	The Saha-Boltzmann Equation	243
10.4	The Black-Body Radiation	247
10.5	Properties of the Black-Body Radiation	252
10.6	The Fermi-Dirac Statistics	256
10.7	The Bose-Einstein Statistics	257
<b>11</b>	<b>Interaction Between Matter and Radiation</b>	261
11.1	The Interaction Hamiltonian	261
11.2	The Kinetic Equations	262
11.3	Fermi's Golden Rule	266
11.4	The Matrix Element	268
11.5	Elementary Processes	271
11.6	The Statistical Equilibrium Equations	276
11.7	Einstein Coefficients	279
11.8	The Radiative Transfer Equation	280
11.9	The Absorption and Emission Coefficients	282
11.10	Profile of the Emission Coefficient	285
<b>12</b>	<b>Selection Rules and Line Strengths</b>	291
12.1	Selection Rules for the Quantum Numbers	291
12.2	Selection Rules for the Configurations	293
12.3	Forbidden Transitions	295
12.4	Semi-forbidden Transitions	297
12.5	Forbidden Lines in Astronomical Objects	298
12.6	Relative Strengths Within Multiplets in L-S Coupling	301
<b>13</b>	<b>Non-equilibrium Plasmas</b>	307
13.1	The Kinetic Temperature of the Electrons	307
13.2	Electron-Atom Collisions	309
13.3	The Einstein-Milne Relations	311
13.4	The Two-Level Atom in Non-equilibrium Conditions	312

<b>14</b>	<b>Radiative Transfer</b>	315
14.1	Formal Solution of the Radiative Transfer Equation	315
14.2	Radiative Transfer in Stellar Atmospheres	317
14.3	The Grey Atmosphere	321
14.4	The Hopf Equation	325
14.5	Realistic Models of Stellar Atmospheres	326
14.6	The Continuum Spectrum	328
14.7	Spectral Lines in Local Thermodynamic Equilibrium	332
14.8	Spectral Lines in Non-equilibrium Conditions	334
<b>15</b>	<b>Second Order Processes</b>	337
15.1	Introduction	337
15.2	Thomson Scattering (Quantum Approach)	341
15.3	The Rayleigh and Raman Scattering (Quantum Approach)	344
15.4	Compton Scattering, Kinematic Aspects	347
15.5	Compton Scattering, Dynamic Aspects	348
15.6	The Klein-Nishina Equation	355
15.7	The Total Cross-Section for Compton Scattering	361
15.8	Polarisation Properties of Compton Scattering	362
15.9	Energy Exchange Between Photons and Electrons	365
15.10	The Inverse Compton Scattering	366
<b>16</b>	<b>Appendix</b>	369
16.1	Units of Measurement for Electromagnetic Phenomena	369
16.2	Tensor Algebra	376
16.3	The Dirac Delta Function	383
16.4	Recovering the Elementary Laws of Electromagnetism	385
16.5	The Relativistic Larmor Equation	388
16.6	Gravitational Waves	391
16.7	Calculation of the Thomas-Fermi Integral	394
16.8	Energy of the Ground Configuration of the Silicon Atom	395
16.9	Calculation of the Fine-Structure Constant of a Term	397
16.10	The Fundamental Principle of Statistical Thermodynamics	399
16.11	Transition Probability for the Coherences	402
16.12	Sums over the Magnetic Quantum Numbers	405
16.13	Calculation of a Matrix Element	408
16.14	Gauge Invariance in Quantum Electrodynamics	409
16.15	The Gamma Matrices and the Relativistic Invariants	411
16.16	Physical Constants	418

Atomic Spectroscopy and Radiative Processes

Landi Degl'Innocenti, E.

2014, XII, 430 p. 79 illus., Hardcover

ISBN: 978-88-470-2807-4
