

Contents

1	Why Such an Effort?	1
1.1	The Problem with the Magnification	1
1.2	The Limitation of Resolution	2
1.3	Electron Waves	6
1.4	The Role of Magnification	8
2	What Should we Know about Electron Optics and the Construction of an Electron Microscope?	11
2.1	The Principle of Multistage Imaging	11
2.2	Rotational-Symmetric Magnetic Fields as Electron Lenses	12
2.3	Lens Aberrations	15
2.4	Resolution Limit Considering the Spherical Aberration	19
2.5	Electron Gun	20
2.6	“Richtstrahlwert” (Brightness)	24
2.7	We Construct an Electron Microscope	27
2.7.1	Illumination System	27
2.7.2	Imaging System	29
2.7.3	Specimen Stage	30
2.7.4	Acquiring the Images	32
2.7.5	Vacuum System	34
2.7.6	Miscellaneous	37
	References	39
3	We Prepare Electron-Transparent Samples	41
3.1	What is the Challenge?	41
3.2	“Classical” Methods	43
3.3	Cutting, Grinding, and Ion Milling	47
3.4	Focussed Ion Beam (“FIB”) Techniques	51
	References	56

4	Let us Start with Practical Microscopy	57
4.1	What do We Peripherally Need?	58
4.2	We Put the Specimen into the Holder and Insert it into the Microscope	59
4.3	We Check the (alignment) State of the Microscope	61
4.4	Focussing the Image—Sharpness and Contrast	69
4.5	Contamination and Sample Damaging	70
	References	73
5	Let us Switch to Electron Diffraction	75
5.1	Why Diffraction Reflections?	75
5.2	Crystal Lattices and Lattice Planes	78
5.3	Selected Area and Convergent Beam Electron Diffraction	84
5.4	What Can We Learn from Selected Area Diffraction Patterns?	90
5.4.1	Radii in Ring Diagrams	90
5.4.2	Rules for Forbidden Reflections	93
5.4.3	Intensities of the Diffraction Reflections	98
5.4.4	Positions of Diffraction Reflections in Point Diagrams	99
5.4.5	Indexing of Diffraction Reflections	103
5.5	Kikuchi- and HOLZ-lines	106
5.6	Amorphous Samples	110
	References	112
6	Why Do We See Any Contrast in the Images?	115
6.1	Elastic Scattering of Electrons Within the Sample	115
6.2	Mass Thickness and Diffraction Contrast	116
6.3	Brightfield and Darkfield Imaging	120
6.4	Bending Contours, Dislocations, and Semicohherent Particles	123
6.5	Thickness Contours, Stacking Faults, and Twins	128
6.6	Moiré Patterns	132
6.7	Magnetic Domains: Lorentz Microscopy	133
	References	136
7	We Increase the Magnification	137
7.1	Imaging of Atomic Columns in Crystals: Phase Contrast	137
7.2	Contrast Transfer by the Objective Lens	142
7.3	Wave-optical Interpretation of the Resolution Limit	145
7.4	Periodic Distribution of Brightness in Pictures: Fourier Analysis	147
7.5	Mass Thickness and Phase Contrast	150
7.6	Contrast of Amorphous Samples	152
7.7	Correction of Astigmatism	154
7.8	Measurement of the Resolution Limit	156
7.9	Correction of Spherical and Chromatic Aberration	158
7.10	Interpretation of High Resolution TEM Images	161
	References	162

8	Let Us Switch to Scanning Transmission Electron Microscopy	163
8.1	What Happens Electron-Optically?.....	163
8.2	Resolution or: What is the Smallest Diameter of the Electron Probe?.....	165
8.3	Contrast in the Scanning Transmission Electron Microscopic Image	170
8.4	Speciality: High Angle Annular Darkfield Detector	173
	References	174
9	Let us Use the Analytical Possibilities	177
9.1	Analytical Signals by Inelastic Interaction	177
9.1.1	Emission of X-rays	178
9.1.2	Electron Energy Losses	182
9.2	Energy Dispersive Spectroscopy of Characteristic X-rays ("EDXS")	185
9.2.1	X-ray Spectrometers and Spectra	186
9.2.2	Qualitative Interpretation of X-ray Spectra	190
9.2.3	Quantifying X-ray Spectra.....	194
9.2.4	Line Profiles and Elemental Mappings.....	202
9.3	Electron Energy Loss Spectroscopy ("EELS").....	204
9.3.1	Electron Energy Spectrometer	205
9.3.2	Low-Loss and Core-Loss Regions of the Spectra	206
9.3.3	Qualitative Elemental Analysis.....	209
9.3.4	Background and Multiple Scattering: Requirements to the Sample	210
9.3.5	Measurement of the Specimen Thickness	213
9.3.6	Edge Fine Structure: Bonding Analysis.....	216
9.3.7	Quantifying Energy Loss Spectra	219
9.4	Energy Filtered Imaging.....	221
9.5	Comparison Between EDXS and EELS	224
	References	225
10	Basics Explained in More Detail (with a Bit More Mathematics)	227
10.1	Diffraction at an Edge (Huygens' Principle).....	227
10.2	Wave Function for Electrons	228
10.3	Electron Wavelength Relativistically Calculated	233
10.4	Electron Beam Paths in Rotational-Symmetric Magnetic Fields....	234
10.5	Resolution Limit Considering Spherical Aberration.....	243
10.6	Schottky Effect.....	244
10.7	Electric Potential in Rotational-Symmetric Arrangements of Electrodes.....	247
10.8	Laue Equations and Reciprocal Lattice, Ewald Construction.....	249
10.9	Kinematical Model: Lattice Factor and Structure Factor	261
10.10	Debye Scattering	268
10.11	Electrons Within a Field of a Central Force	272

10.12	Mean Free Path for Elastic Scattering.....	277
10.13	Distances in Moiré Patterns.....	279
10.14	Contrast Transfer Function.....	282
10.15	Scherzer Focus	290
10.16	Delocalisation.....	294
10.17	Potential in Electrostatic Multipoles	297
10.18	Electron Probe and Aberrations.....	299
10.19	Classical Inelastic Collision	306
10.20	Efficiency of Energy Dispersive X-ray Detectors.....	307
10.21	Calculation of Cliff-Lorimer k-factors.....	313
10.22	Correction of Absorption for EDXS.....	318
10.23	Prisms for Electrons	320
10.24	Convolution of Functions.....	324
	References	327
	Summary and Outlook	329
	Physical Constants	331
	Hints for Further Reading	333
	Index.....	335

Analytical Transmission Electron Microscopy

An Introduction for Operators

Thomas, J.; Gemming, Th.

2014, XVII, 348 p. 238 illus., 33 illus. in color.,

Hardcover

ISBN: 978-94-017-8600-3
