

Contents

- 1 Introduction 1**
 - 1.1 Epidemiology 1
 - 1.2 Classification of Infectious Diseases 1
 - 1.3 Basic Definitions in the Epidemiology of Infectious Diseases 3
 - 1.4 Historical Remarks on Infectious Diseases and Their Modeling 4
 - 1.5 General Approach to Modeling 6

- 2 Introduction to Epidemic Modeling 9**
 - 2.1 Kermack–McKendrick SIR Epidemic Model 9
 - 2.1.1 Deriving the Kermack–McKendrick Epidemic Model 9
 - 2.1.2 Mathematical Properties of the SIR Model 12
 - 2.2 The Kermack–McKendrick Model: Estimating Parameters from Data 15
 - 2.2.1 Estimating the Recovery Rate 15
 - 2.2.2 The SIR Model and Influenza at an English Boarding School 1978 17
 - 2.3 A Simple SIS Epidemic Model 18
 - 2.3.1 Reducing the SIS Model to a Logistic Equation 19
 - 2.3.2 Qualitative Analysis of the Logistic Equation 21
 - 2.3.3 General Techniques for Local Analysis of Single-Equation Models 23
 - 2.4 An SIS Epidemic Model with Saturating Treatment 25
 - 2.4.1 Reducing the SIS Model with Saturating Treatment to a Single Equation 26
 - 2.4.2 Bistability 28
 - Problems 29

- 3 The SIR Model with Demography: General Properties of Planar Systems 33**
 - 3.1 Modeling Changing Populations 33
 - 3.1.1 The Malthusian Model 33

3.1.2	The Logistic Model as a Model of Population Growth	35
3.1.3	A Simplified Logistic Model	36
3.2	The SIR Model with Demography	37
3.3	Analysis of Two-Dimensional Systems	39
3.3.1	Phase-Plane Analysis	40
3.3.2	Linearization	44
3.3.3	Two-Dimensional Linear Systems	45
3.4	Analysis of the Dimensionless SIR Model	48
3.4.1	Local Stability of the Equilibria of the SIR Model	48
3.4.2	The Reproduction Number of the Disease \mathcal{R}_0	50
3.4.3	Forward Bifurcation	51
3.5	Global Stability	52
3.5.1	Global Stability of the Disease-Free Equilibrium	52
3.5.2	Global Stability of the Endemic Equilibrium	53
3.6	Oscillations in Epidemic Models	56
	Problems	63
4	Vector-Borne Diseases	67
4.1	Vector-Borne Diseases: An Introduction	67
4.1.1	The Vectors	67
4.1.2	The Pathogen	68
4.1.3	Epidemiology of Vector-Borne Diseases	68
4.2	Simple Models of Vector-Borne Diseases	70
4.2.1	Deriving a Model of Vector-Borne Disease	70
4.2.2	Reproduction Numbers, Equilibria, and Their Stability	73
4.3	Delay-Differential Equation Models of Vector-Borne Diseases	75
4.3.1	Reducing the Delay Model to a Single Equation	76
4.3.2	Oscillations in Delay-Differential Equations	79
4.3.3	The Reproduction Number of the Model with Two Delays	83
4.4	A Vector-Borne Disease Model with Temporary Immunity	85
	Problems	86
5	Techniques for Computing \mathcal{R}_0	91
5.1	Building Complex Epidemiological Models	91
5.1.1	Stages Related to Disease Progression	91
5.1.2	Stages Related to Control Strategies	94
5.1.3	Stages Related to Pathogen or Host Heterogeneity	97
5.2	Jacobian Approach for the Computation of \mathcal{R}_0	98
5.2.1	Examples in Which the Jacobian Reduces to a 2×2 Matrix	99
5.2.2	Routh–Hurwitz Criteria in Higher Dimensions	100
5.2.3	Failure of the Jacobian Approach	103
5.3	The Next-Generation Approach	104
5.3.1	Van den Driessche and Watmough Approach	104
5.3.2	Examples	108
5.3.3	The Castillo-Chavez, Feng, and Huang Approach	116
	Problems	119

6	Fitting Models to Data	123
6.1	Introduction	123
6.2	Fitting Epidemic Models to Data: Examples	125
6.2.1	Using Matlab to Fit Data for the English Boarding School	126
6.2.2	Fitting World HIV/AIDS Prevalence	130
6.3	Summary of Basic Steps	133
6.4	Model Selection	134
6.4.1	Akaike Information Criterion	135
6.4.2	Example of Model Selection Using AIC	137
6.5	Exploring Sensitivity	139
6.5.1	Sensitivity Analysis of a Dynamical System	139
6.5.2	Sensitivity and Elasticity of Static Quantities	142
	Problems	144
7	Analysis of Complex ODE Epidemic Models: Global Stability	149
7.1	Introduction	149
7.2	Local Analysis of the SEIR Model	150
7.3	Global Stability via Lyapunov Functions	153
7.3.1	Lyapunov–Kasovskii–LaSalle Stability Theorems	153
7.3.2	Global Stability of Equilibria of the SEIR Model	154
7.4	Hopf Bifurcation in Higher Dimensions	158
7.5	Backward Bifurcation	165
7.5.1	Example of Backward Bifurcation and Multiple Equilibria	165
7.5.2	Castillo-Chavez and Song Bifurcation Theorem	173
	Problems	176
8	Multistrain Disease Dynamics	183
8.1	Competitive Exclusion Principle	183
8.1.1	A Two-Strain Epidemic SIR Model	183
8.1.2	The Strain-One- and Strain-Two-Dominance Equilibria and Their Stability	186
8.1.3	The Competitive Exclusion Principle	189
8.2	Multistrain Diseases: Mechanisms for Coexistence	190
8.2.1	Mutation	191
8.2.2	Superinfection	192
8.2.3	Coinfection	194
8.2.4	Cross-Immunity	195
8.3	Analyzing Two-Strain Models with Coexistence: The Case of Superinfection	197
8.3.1	Existence and Stability of the Disease-Free and Two Dominance Equilibria	197
8.3.2	Existence of the Coexistence Equilibrium	202
8.3.3	Competitive Outcomes, Graphical Representation, and Simulations	205

8.4	Computing the Invasion Numbers Using the Next-Generation Approach	207
8.4.1	General Description of the Method	207
8.4.2	Example	210
	Problems	212
9	Control Strategies	215
9.1	Introduction	215
9.2	Modeling Vaccination: Single-Strain Diseases	216
9.2.1	A Model with Vaccination at Recruitment	217
9.2.2	A Model with Continuous Vaccination	217
9.3	Vaccination and Genetic Diversity of Microorganisms	224
9.4	Modeling Quarantine and Isolation	230
9.5	Optimal Control Strategies	234
9.5.1	Basic Theory of Optimal Control	235
9.5.2	Examples	237
	Appendix	242
	Problems	244
10	Ecological Context of Epidemiology	249
10.1	Infectious Diseases in Animal Populations	249
10.2	Generalist Predator and SI-Type Disease in Prey	251
10.2.1	Indiscriminate Predation	252
10.2.2	Selective Predation	253
10.3	Generalist Predator and SIR-Type Disease in Prey	254
10.3.1	Selective Predation	255
10.3.2	Indiscriminate Predation	257
10.4	Specialist Predator and SI Disease in Prey	258
10.4.1	Lotka–Volterra Predator–Prey Models	259
10.4.2	Lotka–Volterra Model with SI Disease in Prey	262
10.5	Competition of Species and Disease	268
10.5.1	Lotka–Volterra Interspecific Competition Models	269
10.5.2	Disease in One of the Competing Species	273
	Problems	276
11	Zoonotic Disease, Avian Influenza, and Nonautonomous Models	281
11.1	Introduction	281
11.2	Modeling Avian Influenza	282
11.2.1	Simple Bird–Human Avian Influenza Model	282
11.2.2	Parameterizing the Simple Avian Influenza Model	283
11.2.3	Evaluating Avian Influenza Control Strategies	284
11.3	Seasonality in Avian Influenza Modeling	286
11.3.1	An Avian Influenza Model with Seasonality	286
11.3.2	Tools For Nonautonomous Models	288

11.3.3	Analyzing the Avian Influenza Model with Seasonality	291
11.3.4	The Nonautonomous Avian Influenza Model with $v_d = 0$. . .	293
11.3.5	The Full Nonautonomous Avian Influenza Model	296
	Appendix	296
	Problems	299
12	Age-Structured Epidemic Models	301
12.1	Introduction	301
12.2	Linear Age-Structured Population Model	301
12.2.1	Derivation of the Age-Structured Model	302
12.2.2	Reformulation of the Model Through the Method of the Characteristics. The Renewal Equation	307
12.2.3	Separable Solutions. Asymptotic Behavior	309
12.3	Age-Structured SIS Epidemic Models	312
12.3.1	Introduction of the SIR Age-Structured Epidemic Model . . .	313
12.3.2	Equilibria and Reproduction Number	315
12.3.3	Local Stability of the Disease-Free Equilibrium	317
12.4	Numerical Methods for Age-Structured Models	321
12.4.1	A Numerical Method for the McKendrick–von Foerster Model	321
12.4.2	Numerical Method for the Age-Structured SIR Model	324
	Problems	326
13	Class-Age Structured Epidemic Models	331
13.1	Variability of Infectivity with Time-Since-Infection	331
13.2	Time-Since-Infection Structured SIR Model	333
13.2.1	Derivation of the Time-Since-Infection Structured Model . . .	333
13.2.2	Equilibria and Reproduction Number of the Time-Since-Infection SIR Model	337
13.2.3	Local Stability of Equilibria	339
13.3	Influenza Model Structured with Time-Since-Recovery	344
13.3.1	Equilibria of the Time-Since-Recovery Model	344
13.3.2	Stability of Equilibria	346
13.3.3	Numerical Method for the Time-Since-Recovery Model . . .	351
	Appendix	355
	Problems	357
14	Immuno-Epidemiological Modeling	361
14.1	Introduction to Immuno-Epidemiological Modeling	361
14.2	Within-Host Modeling	362
14.2.1	Modeling Replication of Intracellular Pathogens	363
14.2.2	Modeling the Interaction of the Pathogen with the Immune System	365
14.2.3	Combining Intracellular Pathogen Replication and Immune Response	367

14.3	Nested Immuno-Epidemiological Models	368
14.3.1	Building a Nested Immuno-Epidemiological Model	369
14.3.2	Analysis of the Immuno-Epidemiological Model	371
14.3.3	Dependence of \mathcal{R}_0 and Prevalence on Immunological Parameters	374
14.3.4	Sensitivity and Elasticity of \mathcal{R}_0 and Prevalence with Respect to Immunological Parameters	377
14.4	A Nested Immuno-Epidemiological Model with Immune Response	379
	Problems	383
15	Spatial Heterogeneity in Epidemiological Models	387
15.1	Introduction	387
15.2	Metapopulation Modeling of Epidemic Spread	388
15.2.1	Lagrangian Movement Epidemic Models	389
15.2.2	Eulerian Movement Epidemic Models	391
15.3	Spatial Models with Diffusion	392
15.3.1	Derivation of Reaction–Diffusion Equations	393
15.3.2	Equilibria and Their Local Stability	396
15.3.3	Traveling-Wave Solutions	399
15.3.4	Turing Instability	405
	Problems	411
16	Discrete Epidemic Models	415
16.1	Single-Species Discrete Population Models	415
16.1.1	Simple Discrete Population Models	415
16.1.2	Analysis of Single-Species Discrete Models	418
16.2	Discrete Epidemic Models	421
16.2.1	A Discrete SIS Epidemic Model	421
16.2.2	Analysis of Multidimensional Discrete Models	422
16.2.3	Analysis of the SIS Epidemic Model	424
16.3	Discrete SEIS Model	427
16.4	Next-Generation Approach for Discrete Models	431
16.4.1	Basic Theory	431
16.4.2	Examples	432
	Problems	437
