

Contents

1	Motivating Examples and Other Preliminaries	1
1.1	Some Motivating Examples	1
1.2	Application: Polymerase Chain Reaction and Branching Processes	3
1.2.1	Introduction About the Mechanics of PCR	3
1.2.2	Mathematical Model	4
1.2.3	Genealogical Approach	5
1.2.4	Statistical Estimation of the Mutation Rate	7
1.2.5	Mutagenic PCR and Artificial Evolution	7
1.3	The Branching Property	9
1.4	Probability Generating Functions and Analytical Methods	11
1.5	Classifications of the Branching Processes	13
1.5.1	Lifetime	13
1.5.2	Type Space	13
1.5.3	Criticality	13
1.6	Modeling with Branching Processes	15
2	Biological Background	19
2.1	Genomes: Changes in DNA and Chromosomes	19
2.1.1	Genome	19
2.1.2	DNA and Genes	19
2.1.3	Mutation	20
2.1.4	Noncoding Sequences of DNA	21
2.1.5	Repeated Sequences of DNA	21
2.1.6	Gene Amplification	22
2.1.7	Chromosomes	22
2.1.8	DNA Replication	23
2.1.9	Recombination	24
2.2	Cells: Cell Cycle Kinetics and Cell Division	25
2.2.1	Cells as the Basic Units of Life	25
2.2.2	Cell Growth, Division, and Death	26
2.2.3	Stem Cells	27
2.2.4	Cell Cycle Kinetics	28

2.3	Cancer	28
2.3.1	Cancer Cell Populations Are Immortal	28
2.3.2	Tumor Heterogeneity and Instability	29
2.3.3	Cell Cycle and Resistance to Chemotherapy	29
2.3.4	Mutations in Cancer Cells	30
2.3.5	Tumor Progression	30
2.4	Population Genetics and Evolution	31
2.4.1	Wright–Fisher Model and Coalescent-Based Models	31
2.4.2	Human Immunodeficiency Virus	31
2.5	References	32
2.5.1	Textbooks and Monographs in Biology	32
2.5.2	Mathematical Biology	34
2.5.3	Arguments for Mathematical Modeling Biological Phenomena, with Examples	36
3	The Galton–Watson Process	37
3.1	Construction, Functional Equation, and Elementary Properties	37
3.1.1	Backward Equation	38
3.1.2	Forward Equation	39
3.1.3	Moments	40
3.1.4	The Linear-Fractional Case	40
3.2	Application: Cell Cycle Model with Death and Quiescence	41
3.2.1	The Mathematical Model	41
3.2.2	Modeling Biological Data	42
3.3	Extinction and Criticality	45
3.4	Application: Complexity Threshold in the Evolution of Early Life . .	46
3.5	Asymptotic Properties	47
3.5.1	Supercritical Process	47
3.5.2	Subcritical Process	49
3.5.3	Critical Process	50
3.6	Application: Cancer Mutations	51
3.6.1	Modeling Driver and Passenger Mutations	51
3.6.2	Distribution of Mutational Events in Various Phases of Tumor Growth	52
3.7	Application: Gene Amplification	53
3.7.1	Gene Amplification and Drug Resistance	54
3.7.2	Galton–Watson Process Model of Gene Amplification and Deamplification	54
3.7.3	Mathematical Model of the Loss of Resistance	56
3.7.4	Probabilities of Gene Amplification and Deamplification from MTX Data	57
3.8	Application: Iterated Galton–Watson Process and Expansion of DNA Repeats	58
3.8.1	Dynamics of DNA Repeats in Human Pedigrees	58
3.8.2	Definition of the Process	59

3.8.3	Example	61
3.8.4	Properties	61
3.9	Application: Galton–Watson Processes in Random Environment and Macroeolution	64
3.9.1	Reduced Trees for Subcritical GWBPRES	64
3.9.2	Evolutionary Interpretation	65
3.10	Other Works and Applications	66
3.10.1	Stochastic Dependence	66
3.10.2	Process State Dependence	66
3.10.3	Bisexual Galton–Watson Process	67
3.10.4	Age of the Process	67
3.10.5	Family Trees and Subtrees	68
3.10.6	Model of Next Generation Sequencing	68
3.11	Problems	69
4	The Age-Dependent Process: Markov Case	71
4.1	Differential Equation for the pgf and its Elementary Properties	71
4.1.1	Definition of the Process	71
4.1.2	Probability of Extinction and Moments	73
4.2	Application: Clonal Resistance Theory of Cancer Cells	74
4.2.1	Single-Mutation Case	75
4.2.2	Two-Mutations Case	79
4.3	Other Works and Applications	83
4.3.1	Fluctuation Analysis	83
4.4	Problems	84
5	The Bellman–Harris Process	87
5.1	Integral Equations for the pgf and Basic Properties	87
5.1.1	Heuristic Derivations	87
5.2	Renewal Theory and Asymptotics of the Moments	88
5.2.1	Basics of the Renewal Theory	89
5.2.2	The Moments	90
5.3	Asymptotic Properties of the Process in the Supercritical Case	91
5.4	Application: Analysis of the Stathmokinetic Experiment	92
5.4.1	Age Distributions	92
5.4.2	The Stathmokinetic Experiment	92
5.4.3	Model	94
5.4.4	Estimation	96
5.5	Other Works and Applications	97
5.5.1	Cell Populations	97
5.5.2	Cell Proliferation	99
5.5.3	Estimation of Cell Lifetimes	101
5.5.4	Bifurcating Autoregression	103
5.5.5	Branching Processes and Cancer Therapy	103
5.6	Problems	104

6	Multitype Processes	107
6.1	Application: Mutations and Fluctuation Analysis	107
6.1.1	Luria–Delbrück Model	108
6.1.2	The Markov Branching Process Model	110
6.1.3	The Galton–Watson Process Model	111
6.1.4	The Galton–Watson Process Model with Cell Death	112
6.1.5	Two-Stage Galton–Watson Process Model	113
6.1.6	The Single-Stage Models Versus Data	115
6.1.7	The Two-Stage Model Versus Data	118
6.1.8	Modified Median Estimator of Mutation Rates	119
6.1.9	Modified Median Estimator Versus Data	123
6.1.10	Recent Developments in Theory and Application of Fluctuation Analysis	126
6.2	The Positive Regular Case of the Multitype Galton–Watson Process	129
6.2.1	Basics	129
6.2.2	Positivity Properties	131
6.2.3	Asymptotic Behavior in the Supercritical Case	131
6.2.4	Probability of Extinction	132
6.3	Application: A Model of Two-Cell Populations	132
6.4	Application: Stochastic Model of the Cell Cycle with Chemotherapy	133
6.4.1	Model of Drug-Perturbed Stathmokinesis	134
6.4.2	Model Parameters	138
6.4.3	Prediction of the Effects of Continuous Exposure to the Drug	139
6.4.4	Results	139
6.4.5	Discussion	142
6.5	Application: Cell Surface Aggregation Phenomena	142
6.5.1	Relationship Between the Galton–Watson Process and the Aggregation Process	143
6.5.2	Progeny Distributions	144
6.5.3	Antigen Size Distribution on a Cell Surface	144
6.6	Sampling Formulae for Multitype Galton–Watson Process	146
6.6.1	Formulae for Mean and Variance	147
6.6.2	The Markov Property	147
6.7	Application: Deletions in Mitochondrial DNA	148
6.8	Application: Polymerase Chain Reaction	150
6.9	Other Works and Applications	151
6.9.1	Hemopoiesis and Clonal Cell Populations	151
6.9.2	Gene Amplification	152
6.9.3	Modeling in Varying Environments	153
6.9.4	Model of Ovarian Cancer Progression and Metastasis	153
6.9.5	HIV Modeling	154

7	Branching Processes with Infinitely Many Types	155
7.1	Galton–Watson and Bellman–Harris Processes with Denumerably Many Types and Branching Random Walks	155
7.2	Generalized Linear-Fractional Distributions and Their Applications	157
7.2.1	Introduction	157
7.2.2	Definitions and Basic Properties	158
7.2.3	Applications in Branching Processes	160
7.3	Biological Models with Denumerable Infinity of Types	161
7.4	Application: A Model of Unstable Gene Amplification	162
7.5	Application: Stable Gene Amplification	165
7.5.1	Assumptions	166
7.5.2	Pgf's and Expectations	168
7.5.3	Model Versus Data	170
7.6	Application: Quasistationarity in a Branching Model of Division-Within-Division	171
7.6.1	Definition of the Process	172
7.6.2	Quasistationarity	174
7.6.3	Gene Amplification	175
7.7	Application: Mathematical Modeling of the Loss of Telomere Sequences	175
7.7.1	Stochastic Model	175
7.7.2	Branching Process	178
7.7.3	Analysis in the Markov Case	180
7.7.4	Model Versus Data	181
7.7.5	Further Work on Telomere Modeling	183
7.8	Application: Structured Cell Population Models	185
7.8.1	A Model of Unequal Division and Growth Regulation in Cell Colonies	186
7.8.2	Cell Cycle Model with Cell-Size Control, Unequal Division of Cells, and Two Cell Types	190
7.9	Application: Yule's Evolutionary Process	196
7.10	Application: Branching Process with Infinite-Allele Mutations	198
7.10.1	Proliferation of Alu Repeats	198
8	Genealogies of Branching Processes and Their Applications	207
8.1	Genealogies of Branching Processes	207
8.2	"Near-Critical" Processes	209
8.3	Application: Estimation of the Age of the Mitochondrial Eve	212
8.3.1	Population Genetic Model	212
8.3.2	Numerical Estimates	215
8.3.3	Robustness of Mitochondrial Eve	216

Appendix A Multivariate Probability Generating Functions	221
Appendix B Probability Distributions for the Bellman–Harris Process . . .	223
B.1 Construction	223
B.1.1 The Families	223
B.1.2 The Number of Objects at Given Time	224
B.1.3 Probability Measure	224
B.1.4 The Embedded Galton–Watson Process and Extinction Probability	225
B.2 Integral Equation	226
B.2.1 Decomposition into Subfamilies	226
B.2.2 Generating Functions	226
B.2.3 Uniqueness of $F(s, t)$ and Finiteness of $Z(t)$	227
Appendix C General Processes	229
C.1 Introduction to the Jagers–Crump–Mode Process	229
C.1.1 Definition of the General Branching Process	229
C.1.2 Random Characteristics and Basic Decomposition	230
C.1.3 Expectations, Malthusian Parameter and Exponential Growth	231
C.1.4 Abstract Type Spaces and Composition of the Process	233
C.2 Application: Alexandersson’s Cell Population Model Using a General Branching Process	235
C.2.1 The Model	235
C.2.2 Existence of the Stable Birth Size Distribution	237
C.2.3 Asymptotics of the Cell Model	237
Glossary	239
Biological Glossary for Mathematicians	239
Mathematical Glossary for Biologists	245
References	253
Author Index	273
Subject Index	277

Branching Processes in Biology

Kimmel, M.; Axelrod, D.

2015, XX, 280 p. 69 illus., 3 illus. in color., Hardcover

ISBN: 978-1-4939-1558-3
