List of symbols	xix
1 A general view of rate-independent systems	1
1.1 A sweeping process as a motivating example	3
1.2 A definition of rate-independent systems	6
1.3 Evolutionary systems obtained from differential formulations.....	11
1.3.1 A rate-independent evolutionary system	12
1.3.2 Splitting into dissipative and nondissipative parts	13
1.3.3 Formulations via evolutionary variational inequalities	14
1.3.4 Energy-dissipation principle for generalized gradient systems.....	17
1.3.5 Toward the vanishing-viscosity approach	19
1.4 Some canonical examples	20
1.5 Basic a priori estimates.....	22
1.6 Energetic solutions	24
1.6.1 Motivation and definition of energetic solutions.....	24
1.6.2 Advantages of the concept of energetic solutions	25
1.6.3 A first existence result for energetic solutions	26
1.6.4 The energetic versus the differential solution concepts	28
1.7 Derivation of rate-independent dissipation from viscous systems ...	28
1.8 Other solution concepts illustrated in the one-dimensional case	35
1.9 Rate-independent models without energetic structure	41
2 Energetic rate-independent systems	45
2.1 The main existence result	46
2.1.1 Abstract setup of the problem	46
2.1.2 The time-incremental minimization problem	51
2.1.3 Statement of the main existence result	54
2.1.4 Properties of energetic solutions	59

2.1.5	On the compatibility conditions (C1) and (C2)	61
2.1.6	Proof of Theorem 2.1.6	67
2.2	Generalizations	75
2.2.1	Direct treatment of the reduced RIS	75
2.2.2	Other nonsmooth behavior of \mathcal{J}	81
2.2.3	The case of noncompact sublevels of \mathcal{E}	84
2.3	Semicontinuity of approximate incremental problems	85
2.4	Evolutionary Γ -convergence for sequences of ERIS	90
2.4.1	Basics on static Γ -convergence	90
2.4.2	The main assumptions for evolutionary Γ -convergence	95
2.4.3	Convergence of energetic solutions	99
2.4.3.1	Solutions of $(\mathcal{Q}, \mathcal{E}_k, \mathcal{D}_k)$ converge to solutions	100
2.4.3.2	Basic homogenization via evolutionary Γ -convergence	104
2.4.3.3	Solutions of (IMP^H) converge to solutions	105
2.5	Relaxation of ERIS via Γ -convergence	107
2.5.1	Relaxation of incremental minimization problems	107
2.5.2	An example of relaxation via evolutionary Γ -convergence ..	110
2.5.2.1	Coarse relaxation by lower semicontinuous envelope	110
2.5.2.2	Regularization by singular perturbation and its Γ -limit	112
2.5.2.3	Fine relaxation by extension in terms of Young measures	113
3	Rate-independent systems in Banach spaces	117
3.1	Energetic solutions in Banach spaces	118
3.2	Rate-independent dissipation	120
3.2.1	Monotone operators and homogeneity	120
3.2.2	Dissipation potential versus dissipation distance	123
3.3	Differential, CD, and local solutions	128
3.3.1	Notions of subdifferentials	129
3.3.2	Notions of solutions	130
3.3.3	Local solutions with special jump attributes	136
3.4	Systems with convexity properties	142
3.4.1	From local to energetic solutions	142
3.4.2	Temporal continuity of solutions	144
3.4.3	Existence via strong convergence: differential solutions	146
3.4.4	Uniqueness of solutions	150
3.4.5	Partial convexity, semi-implicit discretization, local solutions	151
3.5	Rate-independent systems with quadratic energy	160
3.5.1	Coercive quadratic energies	160
3.5.2	Play and Prandtl–Ishlinskiĭ operators	171
3.5.2.1	Scalar and vector-valued play and stop operators ..	171

3.5.2.2	Prandtl–Ishlinskiĭ operators	172
3.5.2.3	The relay operator and Preisach operators	174
3.5.3	Noncoercive quadratic energies	176
3.5.4	Evolutionary Γ -convergence for quadratic RIS	181
3.5.4.1	Abstract setup and Γ -convergence result	181
3.5.4.2	Quadratic forms	184
3.5.4.3	Proof of Theorem 3.5.14	187
3.5.5	Homogenization of quadratic energies	189
3.6	Numerics for RIS	191
3.6.1	Approximation and convergence	191
3.6.2	Convergence rates in the uniformly convex case	200
3.6.3	Solving incremental minimization problems	205
3.7	Unidirectional rate-independent processes	210
3.8	Solutions obtained in the vanishing-viscosity limit	213
3.8.1	Parameterized solutions via vanishing-viscosity approach	214
3.8.2	BV solutions and optimal jump paths	222
3.8.3	Vanishing-viscosity concept refined: defect measures	228
4	Applications in continuum mechanics and physics of solids	235
4.1	Excursion to continuum mechanics of solids with internal variables	237
4.1.1	Kinematics of deformable continua and hyperelasticity	237
4.1.2	Small strains	243
4.1.3	Excursion to mathematics of elastic solids	244
4.2	Inelastic processes in deformable solids in finite strains	249
4.2.1	Plasticity based on the multiplicative strain decomposition	250
4.2.1.1	General gradient plasticity with hardening	250
4.2.1.2	Numerical approximation in special cases	261
4.2.2	Phase transformations in smart materials	266
4.2.2.1	Nonconvex models in nonsimple materials	267
4.2.2.2	Fighting with multiscales: relaxation	278
4.2.2.3	Example: shape-memory alloys, single-crystal models	284
4.2.3	Delamination, debonding	290
4.2.3.1	Basic scenario of adhesive contacts	291
4.2.3.2	Numerics in special cases	297
4.2.3.3	Cohesive contacts	302
4.2.4	Further models in brief	303
4.2.4.1	Crack growth in brittle materials	303
4.2.4.2	Damage	309
4.3	Inelastic processes at small strains	312
4.3.1	Linearized elastoplasticity	313
4.3.1.1	Plasticity with hardening	313
4.3.1.2	Prandtl–Reuss perfect plasticity	316
4.3.1.3	Various modifications	329

4.3.1.4	Elastoplastic plate model via Γ -convergence	333
4.3.1.5	Homogenization for linearized elastoplasticity.....	342
4.3.2	Damage	346
4.3.2.1	Incomplete damage	347
4.3.2.2	Complete damage.....	352
4.3.2.3	Toward fracture via damage	368
4.3.2.4	Finite-dimensional examples of various solution concepts.....	370
4.3.2.5	Damage in plasticizable materials	379
4.3.3	Phase transformation in polycrystal shape-memory alloys	387
4.3.3.1	Phenomenological Souza–Auricchio model.....	388
4.3.3.2	Models with the free energy of mixing	389
4.3.3.3	Fatigue in a shape-memory model	393
4.3.4	Some further models in brief	394
4.3.4.1	From elastic to brittle delamination.....	394
4.3.4.2	Delamination at mixed modes.....	399
4.3.4.3	Local solution to delamination by fractional steps	404
4.3.4.4	Vanishing-viscosity approach to delamination	412
4.3.4.5	Friction	429
4.3.4.6	From damage to delamination.....	434
4.3.4.7	Modeling of a hook-and-loop fastener.....	435
4.4	Activated processes in ferroic solids	438
4.4.1	Ferromagnetic materials	438
4.4.1.1	Microscopic model	438
4.4.1.2	Fighting with multiscales: a mesoscopical model	444
4.4.1.3	Refinement using magnetic hardening	449
4.4.1.4	Macroscopic models	450
4.4.2	Vortex pinning in superconductivity	452
4.4.3	Deformable ferroics: magnetostriction and piezoelectricity	453
4.4.3.1	A model for magnetostrictive materials	453
4.4.3.2	A model for poling-induced piezoelectricity	456
5	Beyond rate-independence	459
5.1	Rate-independent processes in viscodynamic environment	460
5.1.1	Abstract approach by local- and energetic-solution concepts	461
5.1.2	Further results and concepts when z ranges over Banach spaces	482
5.1.2.1	Energetic solutions and their regularity	482

5.1.2.2	Slow-loading limit to fully rate-independent processes	487
5.1.2.3	Dissipation metric dependent on slow variables ...	490
5.2	Specific applications.....	495
5.2.1	Plasticity	496
5.2.2	Damage in viscoelastic materials	505
5.2.3	Delamination of viscoelastic bodies	511
5.2.4	Frictional contact between viscoelastic bodies	517
5.2.5	Toward fracture.....	525
5.2.6	Inelastic processes in porous media with diffusion	526
5.2.7	Damage or delamination with rate-independent healing	531
5.3	Thermodynamics in special cases	534
5.3.1	Abstract setting.....	535
5.3.2	Energetic solutions to the abstract system (5.3.10)	545
5.3.3	Selected examples.....	560
5.3.3.1	Plasticity in isotropic thermally expanding materials	560
5.3.3.2	Ferro/paramagnetic transformation with pinning effects	569
5.3.3.3	Adhesive contact with a heat-conductive adhesive layer	572
A	Elements of topology and functional analysis.....	579
A.1	Ordering.....	579
A.2	Topology	580
A.3	Locally convex spaces, Banach spaces, Banach algebras	583
A.4	Functions and mappings on Banach spaces, dual spaces	585
A.5	Basics from convex analysis	587
B	Elements of Measure Theory and Function Spaces	591
B.1	General measures	591
B.2	Lebesgue and Hausdorff measures	593
B.3	Lebesgue spaces, Nemytskiĭ mappings.....	595
B.4	Sobolev spaces.....	599
B.5	Abstract functions on $[0, T]$: their variations, integrals, derivatives ..	602
C	Young Measures and Beyond	615
C.1	Young measures: a tool to handle oscillations	615
C.2	Convex local compactifications of L^p -spaces	617
C.3	Suppression of concentration effects	621
	References.....	625
	Index.....	651

Rate-Independent Systems

Theory and Application

Mielke, A.; Roubicek, T.

2015, XXII, 660 p. 75 illus., 13 illus. in color., Hardcover

ISBN: 978-1-4939-2705-0
