Part I Introductory Concepts and Background

1	Introduction	3
1.1	Theory for Initial Boundary Value Problems	4
1.1.1	The Continuous Problem	5
1.1.2	The Semidiscrete Problem	6
1.2	Outline	7
	References	8
2	Random Field Representation	11
2.1	Karhunen-Loève Expansion	12
2.2	Generalized Chaos Expansions	13
2.2.1	Generalized Polynomial Chaos Expansion	13
2.2.2	Haar Wavelet Expansion	16
2.2.3	Multiwavelet Expansion	17
2.2.4	Choice of Basis Functions for Generalized Chaos	20
2.3	Exercises	20
	References	20
3	Polynomial Chaos Methods	23
3.1	Intrusive Methods	23
3.1.1	Stochastic Galerkin Methods	23
3.1.2	Semi-intrusive Methods	24
3.2	Non-intrusive Methods	25
3.2.1	Interpolation and Integration Approaches	25
3.2.2	Spectral Projection	26
3.2.3	Stochastic Multi-elements	27
3.3	Exercises	28
	References	28

4	Numerical Solution of Hyperbolic Problems	31
4.1	Summation-by-Parts Operators	32
4.1.1	Recipe for Constructing a Scheme	32
4.1.2	The Continuous Problem	33
4.2	Analysis	33
4.2.1	Well-Posedness	33
4.2.2	Stability	34
4.2.3	Convergence for Finite Time	36
4.2.4	An Error Bound in Time	37
4.2.5	Artificial Dissipation Operators	38
4.3	Shock-Capturing Methods	38
4.3.1	MUSCL Scheme	38
4.3.2	HLL Riemann Solver	40
4.4	Time Integration	40
4.5	Exercises	42
	References	43

Part II Scalar Transport Problems

5	Linear Transport Under Uncertainty	47
5.1	Problem Definition	48
5.1.1	Uncertainty and Solution Procedure	49
5.1.2	Stochastic Galerkin Projection	49
5.1.3	Diagonalization of the Stochastic Galerkin System	52
5.2	The Eigenvalues of the Diffusion Matrix B	53
5.2.1	General Bounds on the Eigenvalues of B	53
5.2.2	Legendre Polynomial Representation	54
5.2.3	Hermite Polynomial Representation	54
5.3	Boundary Conditions for Well-Posedness	55
5.4	Monotonicity of the Solution	56
5.4.1	Second-Order Operators	56
5.4.2	Fourth-Order Operators	59
5.5	Stability of the Semidiscretized Problem	60
5.5.1	The Initial Value Problem: von Neumann Analysis	60
5.5.2	The Initial Boundary Value Problem	62
5.5.3	Eigenvalues of the Total System Matrix	66
5.5.4	Convergence to Steady-State	69
5.6	Numerical Results	71
5.6.1	The Inviscid Limit	72
5.6.2	Steady-State Calculations	76
5.7	Summary and Conclusions	77
5.8	Supplementary Codes	78
5.9	Exercises	78
	References	79

6	Nonlinear Transport Under Uncertainty	81
6.1	Polynomial Chaos Expansion of Burgers' Equation	82
6.1.1	Entropy and Energy Estimates for the $M = 2$ Case	83
6.1.2	Diagonalization of the System Matrix $A(u^M)$	84
6.2	A Reference Solution	85
6.2.1	Regularity Determined by the gPC Expansion Order	87
6.3	Well-Posedness	88
6.3.1	The Importance of Boundary Conditions	90
6.4	Energy Estimates for Stability	90
6.4.1	Artificial Dissipation for Enhanced Stability	92
6.5	Time Integration	93
6.6	Eigenvalue Approximation	93
6.7	Efficiency of the Polynomial Chaos Method	95
6.7.1	Numerical Convergence	96
6.8	Theoretical Results and Interpretation	98
6.8.1	Analysis of Characteristics: Disturbed Cosine Wave	98
6.9	Summary and Conclusions	106
6.10	Supplementary Codes	107
6.11	Exercises	107
	References	108
7	Boundary Conditions and Data	111
7.1	Dependence on Available Data	111
7.1.1	Complete Set of Data	112
7.1.2	Incomplete Set of Boundary Data	112
7.1.3	Discussion of the Results with Incomplete Set of Data	118
7.2	Summary and Conclusions	120
7.3	Exercises	120
	Reference	121

Part III Euler Equations and Two-Phase Flow

8	gPC for the Euler Equations	125
8.1	Euler Equations with Input Uncertainty	126
8.1.1	Formulation in Roe Variables	127
8.1.2	Stochastic Galerkin Formulation of the Euler Equations	128
8.2	Numerical Method	130
8.2.1	Expansion of Conservative Variables	130
8.2.2	Expansion of Roe's Variables	131
8.2.3	Stochastic Galerkin Roe Average Matrix for Roe Variables	132
8.3	Numerical Results	135
8.3.1	Spatial Convergence	136
8.3.2	Initial Conditions and Discontinuous Solutions	137

8.3.3	Spatial and Stochastic Resolution Requirements	139
8.3.4	Convergence of Multiwavelet Expansions	141
8.3.5	Robustness	142
8.3.6	Computational Cost	144
8.4	Summary and Conclusions	146
	References	148
9	A Hybrid Scheme for Two-Phase Flow	149
9.1	Two-Phase Flow Problem	150
9.2	Smoothness Properties of the Solution	153
9.2.1	Analytical Solution	153
9.2.2	Stochastic Modes	155
9.2.3	The Stochastic Galerkin Solution Modes	155
9.3	Numerical Method	156
9.3.1	Summation-by-Parts Operators	156
9.3.2	HLL Riemann Solver	157
9.3.3	Hybrid Scheme	158
9.4	Numerical Results	165
9.4.1	Convergence of Smooth Solutions	166
9.4.2	Non-smooth Riemann Problem	168
9.5	Summary and Conclusions	169
	References	171
A	Generation of Multiwavelets	173
B	Proof of Constant Eigenvectors of Low-Order MW Triple	
	Product Matrices	175
B.1	Proof of Constant Eigenvectors of A	175
B.2	Eigenvalue Decompositions of A	177
B.2.1	Piecewise Constant Multiwavelets (Haar Wavelets)	177
B.2.2	Piecewise Linear Multiwavelets	177
C	Matlab Codes	179
C.1	Linear Transport	179
C.1.1	Main Code	179
C.1.2	Discretization Operators	183
C.1.3	Boundary Treatment	191
C.1.4	Reference Solution	193
C.2	Non-linear Transport	195
C.2.1	Main Code	195
C.2.2	Discretization Operators	198
C.2.3	Boundary Treatment	207
C.2.4	Reference Solution	210
	Index	213

Polynomial Chaos Methods for Hyperbolic Partial
Differential Equations

Numerical Techniques for Fluid Dynamics Problems in
the Presence of Uncertainties

Pettersson, M.P.; Iaccarino, G.; Nordström, J.

2015, XI, 214 p. 60 illus., 54 illus. in color., Hardcover

ISBN: 978-3-319-10713-4
