

Contents

1	Introduction and Theoretical Prerequisites	1
1.1	Introduction	1
1.1.1	Practical Methods	1
1.1.2	Spanning Lengths	2
1.1.3	Light Interactions	3
1.2	Theoretical Prerequisites	4
1.2.1	The Wavefunction	4
1.2.2	Operators and Basis Functions	5
1.2.3	The Schrödinger Equation	7
1.2.4	Symmetry and Spin	8
1.2.5	The Variational Principle	9
1.2.6	The Molecular Schrödinger Equation and Hartree Atomic Units	10
1.2.7	The Born–Oppenheimer Approximation	10
1.2.8	Perturbation Theory	12
1.2.9	The Hartree–Fock Method	14
	References	16
2	Approximations to the Ground State	19
2.1	Density-Functional Theory	19
2.1.1	Hohenberg–Kohn Theorem	20
2.1.2	Levy Constrained Search Method	21
2.1.3	Kohn–Sham Theory	22
2.1.4	Exchange–Correlation Functionals	25
2.2	From Theory to Practical Method	27
2.2.1	Bloch’s Theorem, Brillouin Zones and Periodic Boundary Conditions	28
2.2.2	Wannier Functions	30
2.2.3	Basis Functions	31

2.2.4	Fast-Fourier Transforms and Ewald Summation	33
2.2.5	Iterative Eigensolvers	34
2.2.6	Norm-Conserving Pseudopotentials	35
2.2.7	Projector Augmented-Wave Formalism	37
2.3	Linear-Scaling Density-Functional Theory	38
2.3.1	The Single-Particle Density Matrix	39
2.3.2	Localised Representation and Non-orthogonality	39
2.3.3	Density Matrix DFT	40
2.3.4	Purification and Penalty Functionals	41
2.3.5	The LNV Method	43
2.3.6	Linear-Scaling DFT	43
	References	44
3	Approximations to Excited States	47
3.1	Time-Dependent Density-Functional Theory	47
3.1.1	The Runge–Gross Theorem	49
3.1.2	The Time-Dependent Kohn–Sham Equations	53
3.1.3	Some Comments on the Runge–Gross Theorem	55
3.2	From Theory to Practical Method	56
3.2.1	The Real-Time TDDFT Approach	56
3.2.2	The Linear-Response Formalism	58
3.2.3	The Exchange-Correlation Kernel	61
3.2.4	The Effective 2-Particle Eigenvalue Equation	62
3.2.5	The Tamm–Dancoff Approximation	64
3.2.6	Sources of Errors in TDDFT Calculations	66
3.3	TDDFT and Many-Body Perturbation Theory	68
3.3.1	Green’s Function Methods	68
3.3.2	The GW-approximation and the Bethe-Salpeter Equation	71
3.3.3	The TDDFT Exchange-Correlation Kernel from a MBPT Perspective	74
3.4	Scaling Considerations: TDDFT versus MBPT	76
	References	77
4	The ONETEP Code	79
4.1	Linear-Scaling DFT in ONETEP	79
4.1.1	Psinc Basis Set	79
4.1.2	NGWF Representation	81
4.1.3	The FFT Box Technique	81
4.1.4	The Two-Step Energy Minimisation	82
4.1.5	Sparsity and Linear Scaling	83
4.1.6	Forces	84

4.2	Relevant Functionality	85
4.2.1	Conduction NGWF Optimisation	85
4.2.2	Linear-Scaling PAW	87
4.2.3	The Implicit Solvent Model	92
4.2.4	The Electronic Enthalpy Method	94
	References	95
5	Linear-Scaling TDDFT in ONETEP	97
5.1	Derivation of the Formalism	99
5.1.1	The TDDFT Operator in $\{\chi_\alpha\}$ and $\{\phi_\beta\}$ representation	99
5.1.2	The Rayleigh–Ritz Value	101
5.1.3	Post-processing Analysis	102
5.1.4	Multiple Excited States	103
5.2	Sparsity and Linear-Scaling	105
5.3	Representing the Conduction Manifold	107
5.4	The Exchange–Correlation Kernel and Spin	109
5.5	Benchmark Tests	111
5.5.1	Pentacene	111
5.5.2	Buckminsterfullerene	116
5.5.3	Chlorophyll	118
5.5.4	Carbon Nanotube	120
5.6	Convergence Properties and Preconditioning	121
5.7	Including Solvation Effects	124
