Foreword V

Notations and more VII

1. Introduction 1

2. Putting in context Cardano's works and mathematics 5
2.1. Cardano as a mathematical writer 5
2.2. A puzzling book 13
2.3. From the "*aliza* problem" to the *De Regula Aliza* . . . 18
2.4. The readers of the *De Regula Aliza* 26
2.5. The mathematical context nowadays 30
2.5.1. Solving quadratic equations 31
2.5.2. Quadratic equations with real coefficients . . . 32
2.5.3. Solving cubic equations 33
2.5.4. Cubic equations with real coefficients 37
2.5.5. Cubic equations with real coefficients solved in a trigonometrical way 40
2.5.6. What Galois theory can say about cubic equations 41
2.5.7. Paradigmatic examples for cubic equations . . 43
2.5.8. Solving quartic equations 45
2.5.9. Quartic equations with real coefficients 49

3. Cardano solves equations in the *Ars Magna* 53
3.1. Miscellaneous considerations regarding equations . . . 56
3.1.1. Solving linear, quadratic, and other simple equations. Coming across the square roots of negative numbers 56

3.1.2. Transformations of equations 60
3.1.3. Cardano solves "middle power equal to the highest power and a number" in "general" . . . 73
3.1.4. "Particular" *versus* "general" 79
3.1.5. Cardano's "royal road" 100
3.1.6. Summing up 103
3.2. Solving depressed cubic equations 105
3.2.1. "On the cube and some things equal to a number" 105
3.2.2. "On the cube equal to some things and a number" 110
3.2.3. "On the cube and a number equal to some things" 115
3.2.4. Summing up 121
3.3. Solving cubic equation lacking in the first degree term 122
3.3.1. "On the cube equal to some squares and a number" 122
3.3.2. "On the cube and some squares equal to a number" 125
3.3.3. "On the cube and a number equal to some squares" 130
3.3.4. Summing up 134
3.4. Solving complete equations 135
3.4.1. "On the cube, some squares, and some things equal to a number" 135
3.4.2. "On the cube and some things equal to some squares and a number" 141
3.4.3. "On the cube and some squares equal to some things and a number" 150
3.4.4. "On the cube equal to some squares, some things, and a number" 151
3.4.5. "On the cube and a number equal to some squares and some things" 153
3.4.6. "On the cube, some things, and a number equal to some squares" 156
3.4.7. "On the cube, some squares, and a number equal to some things" 158
3.4.8. Summing up 161
3.5. Interdependencies and *casus irreducibilis* 161

3.6. Solving quartic equations 165
3.6.1. Cardano's list of the "most general" quartic equations 165
3.6.2. Solving "the square square, some squares, and a number equal to some things" 169
3.6.3. What about the other quartic equations? . . . 172
3.6.4. Summing up 177

4. Earlier encounters with general treatments of equations 179
4.1. Various encounters in the *Practica arithmeticæ* 179
4.1.1. The appendix devoted to equations 180
4.1.2. Summing up 184
4.2. Approaches to cubics in the *Ars magna arithmeticæ* . 185
4.2.1. Shortly again on the square roots of negative numbers 187
4.2.2. Methods that lead to the solution of new cases 188
4.2.3. Transformations of equations 192
4.2.4. "General" shapes for irrational solutions 196
4.2.5. The cubic formulae, or what gets closer to them 214
4.2.6. "Particular" solving methods 232
4.2.7. Summing up 238

5. Strategies to possibly overcome the *casus irriducibilis*: the *De Regula Aliza* 243
5.1. Getting acquainted with the *De Regula Aliza* 243
5.1.1. Overview of the *De Regula Aliza*'s contents . . 247
5.1.2. Again on dating the *Aliza*'s miscellany 263
5.2. The method of the splittings in *Aliza*, Chapter I . . . 264
5.2.1. The splitting (A I.1) 268
5.2.2. The splitting (A I.2)-(A I.7) 273
5.2.3. The remaining splittings 284
5.2.4. Summing up 290
5.3. Analysing the splittings 291
5.3.1. On the origin of the substitution $\mathbf{x} = \mathbf{y} + \mathbf{z}$: a hypothesis on the general shapes for irrational solutions 291

5.3.2. On the origin of the splittings: a hypothesis in relation with *Ars Magna*, Chapter XXV 323
5.3.3. Cardano's last say on the origin of the splittings 334
5.3.4. Studying the splittings by themselves 339
5.3.5. Summing up 349
5.4. Some technical supplements 351
5.4.1. Preliminary study of irrational numbers 352
5.4.2. Again on Proposition (AM VIII.2) 354
5.5. How far goes geometry in the *Aliza*? 361
5.5.1. Cardano's proof of the existence of a solution for $\mathbf{x^3 + a_0 = a_2 x^2}$ 361
5.5.2. Comparing Cardano's proof with his forerunners' one 367
5.5.3. Summing up 377
5.6. Trying for an arithmetic of nasty numbers 378

Conclusions **389**

A. A short history of Cardano's life **395**
A.1. Chronicle of a controversy 398
A.2. Tartaglia's poem 405

B. List of references in and to the *De Regula Aliza* **407**

C. List of Cardano's numerical cubic equations **413**

Bibliography **431**
1. Sources 431
2. Secondary literature 438
