Contents

Introduction **1**

1 The liquid argon time projection chamber **5**
1.1 Working principle 5
1.2 Liquefied argon as a detection medium 8
1.3 Energy dissipation in liquefied argon 11
1.4 Recombination mechanisms 16
1.5 Scintillation mechanisms 21
1.6 Charge carrier transport 22
1.7 Electron attachment losses 25
1.8 Wireplane read-out and signal formation 27

2 The ARGONTUBE detector **29**
2.1 Cryostat design 30
2.2 Field cage design and high voltage generation 31
2.3 Liquid argon purification 35
2.4 UV laser system 39
2.5 Read-out, data-acquisition and triggering systems . . . 41
2.6 Detector operation 45
2.7 Event gallery 47

3 Regeneration system for argon purifiers **51**
3.1 Working principle of argon purifiers 52
3.2 The regeneration system 53
3.3 Measurements and observations 57

4 The Greinacher high-voltage generator **67**
4.1 Model for the Greinacher circuit 69

4.2 The electric field in ARGONTUBE 73
4.3 Cathode voltage measurements 80

5 Realization of a GPU-based track finder 85
5.1 The Hough transform 85
5.2 Brief introduction to CUDA GPGPU programming . . 91
5.3 The GPU-based track finder for ARGONTUBE 93
5.4 Computational speed-up of the Hough transform . . . 99

6 Study of cosmic muon events 105
6.1 Linear energy transfer of muons in liquid argon 106
6.2 Momentum measurement by analysis of MCS 112

7 UV laser methods and measurements 121
7.1 Liquid argon purity measurements 121
7.2 Measurement of the longitudinal diffusion coefficient . 129

Conclusions 137

Bibliography 143
