1	Introduction	1
1.1	Medical Background and Requirements	1
1.2	Advanced Robotics for Medical Rehabilitation	3
1.2.1	Rehabilitation Robots	3
1.2.2	Motivation for Rehabilitation Robots	4
1.2.3	Examples of Rehabilitation Robots	5
1.2.4	Common Features of Rehabilitation Robots	6
1.3	Critical Issues in Rehabilitation	7
1.3.1	Upper Limb Rehabilitation	7
1.3.2	Ankle Rehabilitation	7
1.3.3	Interaction Control	10
1.4	Summary	12
	References	12
2	Literature Review	15
2.1	Medical Needs and Existing Rehabilitation Devices	15
2.1.1	Upper Limb Rehabilitation Robots	15
2.1.2	Ankle Rehabilitation Robots	17
2.1.3	Rehabilitation Robots for Masticatory System	22
2.2	Human Musculoskeletal Models	23
2.2.1	Movements of Upper Limb	23
2.2.2	Model of Ankle Joint	25
2.2.3	Model of Masticatory System	28
2.3	Control of Rehabilitation Robots	28
2.3.1	Motion/Force Control Strategies	28
2.3.2	EMG Signals Based Control	30
2.3.3	Interaction Controllers for Rehabilitation Robots	33
2.4	Discussion	36
2.5	Summary	39
	References	39

3	Physiological Model of the Masticatory System	45
3.1	Introduction to the Masticatory System	45
3.1.1	Skeletal Structure	45
3.1.2	Mandibular Muscles	46
3.1.3	The Temporomandibular Joint (TMJ).	49
3.2	Masticatory System Physiological Model Development	51
3.2.1	Revised Musculotendon Model	51
3.2.2	Jaw Musculoskeletal Model Derivation	53
3.2.3	Kinematic Model	57
3.3	Hybrid Model of the Masticatory System	59
3.3.1	Physiological Model Reconfiguration	60
3.3.2	Analysis of Mandibular Muscle Based on EMG	61
3.4	Jaw Rehabilitation	69
3.4.1	Treatment Methods and Techniques	70
3.4.2	Existing Jaw Exoskeletons and Interfaces	71
3.4.3	Neuromuscular Interface: Conjecture	73
3.5	Summary	77
	References	77
4	Modelling Human Shoulder and Elbow	81
4.1	Anatomy of the Human Upper Limb	81
4.1.1	The Human Shoulder	81
4.1.2	Spherical Wrist Mechanism for Exoskeleton Shoulder	83
4.2	The 4R Mechanism for the Exoskeleton Shoulder	87
4.2.1	Kinematic Modelling of the 4R Mechanism	89
4.2.2	Forward Kinematics	93
4.2.3	Inverse Kinematics	93
4.2.4	Range of Motion of Joint 4 and Shoulder Axial Rotation	98
4.3	Physiological Model of the Elbow Joint	99
4.3.1	Elbow Model Development	99
4.3.2	Model Setup	106
4.4	Elbow Model Validation	108
4.4.1	EMG Digital Signal Processing	108
4.4.2	Physiological Model Validation	111
4.5	Summary	116
	References	116
5	Upper Limb Exoskeleton Development	119
5.1	Design Optimisation of a 4R Shoulder Mechanism	119
5.1.1	Optimisation Algorithms	119
5.1.2	Workspace of the 4R Mechanism	124
5.1.3	Singularity Analysis	129
5.2	Exoskeleton Kinematic Design	135

5.3	Design Considerations	140
5.3.1	Mechanical Interference	140
5.3.2	Range of Motion of Exoskeleton Joints	142
5.3.3	Clearance to User's Upper Limb	142
5.3.4	Joint Alignment	143
5.4	System Configuration	145
5.4.1	Actuators and Sensors	145
5.4.2	Safety Features	145
5.4.3	Human–Robot Interface	146
5.5	Summary	149
	References.	149
6	Motion and Interactive Control for Upper Limb Exoskeleton	151
6.1	Smooth Trajectory Planning	151
6.1.1	Minimum Jerk Trajectory	151
6.1.2	Trajectories for the Shoulder.	154
6.2	Combining a Sequence of Movements	158
6.2.1	Cubic Spline Interpolation	159
6.2.2	Trajectories with Reversing Movement	161
6.2.3	Turning for 2-DOF Spherical Shoulder	162
6.3	Dynamic Model of Exoskeleton	166
6.3.1	Actuator Torque	166
6.3.2	Inertial Torque	167
6.3.3	Gravity Compensation	169
6.3.4	Friction Compensation	169
6.4	Interactive Control Strategies	169
6.4.1	Impedance of an Exoskeleton	170
6.4.2	Control of the Elbow Joint	171
6.4.3	Control of the Redundant Shoulder Mechanism	176
6.5	Summary	182
	References.	183
7	Kinematic and Computational Model of Human Ankle.	185
7.1	Mathematical Description of the Biaxial Ankle Model	185
7.1.1	Identification of the Reduced Biaxial Model	188
7.1.2	Gradient Computation of the Kinematic Model	189
7.2	Online Identification of a Biaxial Ankle Model	190
7.2.1	Online Identification Algorithms	191
7.2.2	Variation of Axis Tilt Angles with Joint Displacements.	194
7.2.3	Variation of Axis Tilt Angles with Measured Euler Angles	195
7.3	Computational Model of the Human Ankle	197
7.3.1	Determination of Model Complexity	197
7.3.2	Modelling of Force Elements	198
7.3.3	Definition of Force Element Parameters	204

7.4	Validation and Application of Ankle Model	207
7.4.1	Simulations Involving Constant Axis Tilt Angles	207
7.4.2	Validation of Passive Moment–Displacement Characteristics	209
7.4.3	Simulation of Active Ankle–Foot Motion/Behaviour	212
7.4.4	Rehabilitation Trajectory Generation	213
7.4.5	Experimental Results	217
7.5	Summary	219
	References.	220
8	Development of the Ankle Rehabilitation Robot	223
8.1	Determination of a Suitable Robot Kinematic Structure	223
8.2	Workspace, Singularity and Force Analyses	227
8.2.1	Analysis for 3-Link Parallel Mechanism.	227
8.2.2	Analysis for 4-Link Parallel Mechanism.	234
8.2.3	Evaluation of 4-Link Design with Additional Constraints	237
8.3	System Description	241
8.4	MIMO Actuator Force Control	243
8.4.1	Simulation Results for Disturbance Rejection and Back-drivability	246
8.4.2	Experimental Results for Stability and Performance Evaluation	249
8.4.3	Comparison of Simulation and Experimental Results.	256
8.5	Summary	256
	References.	257
9	Adaptive Ankle Rehabilitation Robot Control Strategies.	259
9.1	Model Integration and Elementary Robot Control	259
9.1.1	Dynamic Modelling of Parallel Mechanism	259
9.1.2	Integration of Model with Foot and Actuator Dynamics.	261
9.1.3	Elementary Robot Control	264
9.1.4	Simulation and Experimental Results.	265
9.2	Adaptive Interaction Control via Variable Impedance	270
9.2.1	Biomechanical Model-Based Impedance Adjustment.	270
9.2.2	Simulation and Experimental Results.	272
9.3	Adaptive Interaction Control via Assistance Adaptation	275
9.3.1	Impedance Control with Adaptive Feed-Forward Force	275
9.3.2	Alternative Error Dependency Functions	277
9.3.3	Work-Based Stiffness Adaptation	279
9.3.4	Reference Trajectory Modification.	280

9.4	Simulated and Experimental Results	280
9.4.1	Basic Feed-Forward Moment Adaptation	282
9.4.2	Effects of Different Error Dependency Functions	285
9.4.3	Effects of Incremental Work-Based Stiffness Adaptation	289
9.4.4	Effects of Reference Trajectory Modification	293
9.4.5	Summary of Experimental Results.	295
9.5	Overall Control Structure and Implementation of Rehabilitation Exercises	296
9.6	Summary	298
	References.	299
10	Conclusion and Future Work	301
10.1	Book Contributions	301
10.1.1	Human Musculoskeletal Models	301
10.1.2	Development of Rehabilitation Devices	305
10.1.3	Control Strategies for Robot-Assisted Rehabilitation	308
10.2	Outlook and Future Work	312
10.2.1	Design Optimisation and Improvement	312
10.2.2	Further Investigation of Human Models.	314
10.2.3	Advanced Adaptive Interaction Controllers.	317
10.3	Summary	320
	References.	320
	Appendix A: Physiological Model of the Elbow in MATLAB/Simulink	323
	Appendix B: Optimal 4R Mechanism Configurations	331
	Appendix C: Supplementary Material on Robot Design Analysis	341

Advanced Robotics for Medical Rehabilitation
Current State of the Art and Recent Advances
