
Contents

1	The Crisis of Classical Physics	
1.1	Atomic Models	1
1.2	The Problems of Atomic Size and Radiative Collapse	5
1.3	Difficulties Related with Heat Capacities	7
1.4	Photoelectric Effect	12
2	From Einstein to de Broglie	
2.1	Photons	15
2.2	Compton Effect	17
2.3	General Features of Spectra. Bohr Hypotheses	18
2.4	Hydrogen Energy Levels According to Bohr	21
2.5	Energy Levels for an Oscillator and for a Particle in a Segment	25
2.6	Einstein and Debye Theories for the Heat Capacities of Solids	27
2.7	Heat Capacities of Gases	34
2.8	Wave-like Behaviour of Particles: the Bragg and Davisson–Germer Experiments	38
3	Introduction to the Postulates of Quantum Mechanics	
3.1	Introduction	43
3.2	The Mach–Zehnder Interferometer	44
3.3	One Photon Interference Experiments	45
3.4	Description of the Polarization States of a Photon	49
3.5	Discussion of Experiments with Polaroid Sheets	52
3.6	Compatible and Incompatible Measurements: Heisenberg Uncertainty Relation	57
4	The Postulates of Quantum Mechanics	
4.1	The Superposition Principle	61
4.2	Observables	63
4.3	Transition Probabilities	66
4.4	Consequences and von Neumann Postulate	68

4.5	Operators Associated with Observables	72
4.6	Properties of the Operators Associated with Observables	73
4.7	Digression on Dirac Notation	76
4.8	Mean Values	78
4.9	Pure States and Statistical Mixtures	80
4.10	Compatible Observables	84
4.11	Uncertainty Relations	89
4.12	Quantization Postulate	90
5	The Harmonic Oscillator	
5.1	Positivity of the Eigenvalues of Energy	95
5.2	The Energy Levels of the Harmonic Oscillator	97
6	Representation Theory	
6.1	Representations	101
6.2	Heisenberg Representation for the Harmonic Oscillator	104
6.3	Unitary Transformations	106
6.4	The Schrödinger Representation: Preliminary Considerations	109
6.5	The Schrödinger Representation	112
6.6	Physical Interpretation of Schrödinger and Momentum Representations	119
6.7	The Improper Eigenvectors of q_i and p_i	121
6.8	The Relationship between Coordinate and Momentum Representations	124
6.9	The q and p as Observables	128
7	Schrödinger Equation for One-Dimensional Systems	
7.1	The Hamiltonian for the Free Particle	133
7.2	Degeneracy Theorem. Spatial Inversions	135
7.3	General Features of the Solutions of Schrödinger Equation in the One-Dimensional Case	139
7.4	Solutions of Schrödinger Equation: Discrete Eigenvalues	141
7.5	Solutions of Schrödinger Equation: Continuous Eigenvalues	145
8	One-Dimensional Systems	
8.1	The One-Dimensional Harmonic Oscillator in the Schrödinger Representation	149
8.2	Potential Well	152
8.3	Tunnel Effect	157
9	Time-Evolution	
9.1	Time-Evolution in the Schrödinger Picture	161
9.2	Time-Evolution in the Heisenberg Picture	168
9.3	The Classical Limit of Quantum Mechanics	170
10	Angular Momentum	
10.1	Angular Momentum: Commutation Rules	175
10.2	Angular Momentum: Eigenvalues	178

10.3	Rotation Operators	182
10.4	Orbital Angular Momentum	183
11	Particle in a Central Force Field	
11.1	The Schrödinger Equation in a Central Force Field	187
11.2	Two-Particle Systems: Separation of Variables	190
11.3	Energy Levels of Hydrogen-like Atoms	194
11.4	The Three-Dimensional Isotropic Harmonic Oscillator	199
12	Perturbations to Energy Levels	
12.1	Perturbation Theory: Heuristic Approach	203
12.2	The Stark Effect in the Hydrogen Atom	206
12.3	First-Order Perturbation Theory: Formal Treatment	212
12.4	Second-Order Perturbation Theory and Quasi-Degenerate Levels	214
13	Electromagnetic Transitions	
13.1	Introduction	219
13.2	Perturbation Theory for Time-Evolution	220
13.3	Semiclassical Theory of Radiation	223
13.4	Spontaneous Emission	227
13.5	Electric-Dipole Transitions	230
13.6	Selection Rules I	232
13.7	Atom in Magnetic Field: the Normal Zeeman Effect	236
13.8	Polarization and Angular Distribution of Emitted Radiation	241
13.9	The Lifetime of the $n = 2$ Energy Level of Hydrogen Atom	243
14	Introduction to Atomic Physics	
14.1	The Central-Field Approximation	247
14.2	The Variational Method	251
14.3	The Lowest Energy Level of Helium	253
14.4	The Alkali Atoms	256
14.5	Quantum Treatment of the Alkali Atoms	260
15	Composite Systems. Pauli Principle	
15.1	The Hilbert Space for a System with Many Particles: Tensor Product of Hilbert Spaces	267
15.2	The Spin of the Electron	269
15.3	Composition of Angular Momenta	272
15.4	Pauli Exclusion Principle	277
16	Many-Electron Atoms	
16.1	The Energy Levels of the Helium Atom	283
16.2	Classification of the Energy Levels of Atoms	288
16.3	Relationship between Electronic Configuration and Spectroscopic Terms: the Carbon Atom	291
16.4	Spin-orbit Interaction. Fine Structure of the Energy Levels	295
16.5	Hierarchy of Quantum Numbers. Selection Rules II	302
16.6	Atoms in a Magnetic Field: the Anomalous Zeeman Effect	306

17	Elementary Theory of Scattering	
17.1	Introduction	315
17.2	The Cross Section	316
17.3	One-Dimensional Case	317
17.4	Three-Dimensional Case	320
17.5	The Optical Theorem	325
17.6	Central Potential	326
17.7	Applications	330
17.8	Collision of Identical Particles	333
17.9	The Reciprocity Theorem and the Detailed Balance	334
18	The Paradoxes of Quantum Mechanics	
18.1	Introduction	337
18.2	The de Broglie Box	338
18.3	Schrödinger's Cat	340
18.4	What Is a Measurement?	341
18.5	The Einstein–Podolsky–Rosen Paradox	343
18.6	Bell's Theorem	345
	Appendix - Physical Constants	349
	Index	351

Lectures in Quantum Mechanics

A Two-Term Course

Picasso, L.E.

2016, X, 354 p., Hardcover

ISBN: 978-3-319-22631-6
