

Contents

Part I Evolution and Life History Theory

1 Advantages of Evolutionary Theory for Understanding Physical Activity	3
Categories of Analysis	3
Proximate and Ultimate	4
Phylogeny	7
Development	8
Summary	9
References	9
2 Physical Activity and Life History Theory	11
Energetic Costs of Physical Activity	12
Benefits of Physical Activity	14
Summary and Applications	14
References	17
3 Phylogeny and Life History Patterns	19
Human Morphological, Physiological, and Metabolic Adaptations	19
Human Uniqueness in Life History Patterns	22
Summary	24
References	24
4 Physical Activity and Energy Expenditure in Humans	27
Measurement	27
TEE in Humans and Other Primates	30
Physical Activity in Humans over Time and Across Populations	30
References	35

Part II Physical Activity and Energetic Trade-Offs Through the Lifespan

5 Energy Costs and Benefits During Fetal Development and Infancy	41
References	44
6 Energetic Trade-Offs and Physical Activity During Childhood and Adolescence	47
References	51
7 Physical Activity and Reproductive Ecology in Adults	53
Women	53
Men	58
Post-reproductive Age Men and Women	60
References	60

Part III Summary of Proximate Mechanisms, an Integrated Evolutionary Model and Applications

8 Proximate Mechanisms: Psychology, Neuroendocrine System, and Central Nervous System.	65
Interpreting Previous Findings: Why do Psychological Variables Matter Sometimes but not Others?	65
Neuroendocrine System as Potential Mechanism	66
Hypothalamo-Pituitary-Gonadal (HPG) Axis	67
Hypothalamo-Pituitary-Adrenal (HPA) Axis	71
Central Nervous System and Epigenetics as Potential Mechanisms.	73
Summary	74
References	76
9 Summary, Conclusions, and Applications	81
References	85
Index	87

Human Physical Fitness and Activity

An Evolutionary and Life History Perspective

Caldwell, A.E.

2016, XX, 89 p. 7 illus., 2 illus. in color., Softcover

ISBN: 978-3-319-30407-6
