Part I Theory

1	An Introduction to Game Theory	3
1.1	Overview	3
1.2	Fundamentals of Non-cooperative Game Theory	4
1.2.1	Strategic Non-cooperative Games	5
1.2.2	Pure and Mixed Strategies	6
1.2.3	Dominant and Dominated Strategies	7
1.2.4	The Concept of Nash Equilibrium	8
1.2.5	Best-Response Correspondence	9
1.2.6	Pareto Optimal Strategies	9
1.2.7	Examples	10
1.3	Computation of Nash Equilibrium via Iterative Gameplay	14
1.3.1	Iterative Gameplay vs. Repeated Games	14
1.3.2	Decision Rules, Best-Response and Better-Response Dynamics	16
1.3.3	Using Best-Response Dynamics to Find Nash Equilibrium	17
1.3.4	Price of Anarchy	20
	References	21
2	Potential Games	23
2.1	Definition	23
2.1.1	Exact Potential Games	24
2.1.2	Weighted Potential Games	25
2.1.3	Ordinal Potential Games	26
2.1.4	Generalized Ordinal Potential Games	27
2.1.5	Best-Response Potential Games	28
2.1.6	Pseudo-Potential Games	29
2.1.7	Relations Among Classes of Potential Games	29
2.2	Fundamental Properties of Potential Games	30
2.2.1	Nash Equilibrium Existence	30
2.2.2	Nash Equilibrium Convergence	32

2.3	Identification of Potential Games	35
2.3.1	Ordinal and Pseudo- Potential Game Identification	35
2.3.2	Exact Potential Game Identification	41
2.4	Formulation of Exact Potential Games	47
2.4.1	Utility Function Considerations	47
2.4.2	Game Formulation Principles	61
2.5	Further Readings	64
	Appendix	66
	References	68

Part II Applications

3	Frequency Assignment in Distributed OFDMA-Based Systems Using Potential Games	73
3.1	Overview	73
3.2	System Model	76
3.2.1	System Parameters	76
3.2.2	An Interference Mitigation Framework	77
3.3	Analysis of Potential Game	79
3.3.1	Preliminaries	79
3.3.2	Potential Game Formulation	80
3.3.3	Domination in the Strategy Set	82
3.3.4	The Modified Game	84
3.4	Allocation of the Number of Subcarriers	84
3.5	Game Algorithm	86
3.5.1	Power Mechanism	86
3.5.2	Sequential Best-Response Play	87
3.6	Optimality Studies via Price of Anarchy	88
3.7	Simulation Results	89
3.7.1	Nash Equilibrium Convergence	90
3.7.2	Performance of a One-Shot Game	90
3.7.3	Effects of the Number of Subcarriers	94
3.7.4	Performance Evaluation in the Long Run	97
3.7.5	PoA Evaluation	100
3.8	Concluding Remarks	101
	References	102
4	Potential Game Approach to Downlink Multi-Cell OFDMA Networks	105
4.1	Overview	105
4.2	System Model	108
4.3	Potential Game Formulation and Analysis	110
4.3.1	Game Formulation	110
4.3.2	Existence of the Exact Potential Function	111
4.3.3	A Special Case: Overload of MSs	115
4.4	Price of Anarchy Analysis	115

4.5	Distributed Algorithm for Nash Equilibrium	116
4.5.1	Edge-Users Versus Center-Users.....	116
4.5.2	Power Mechanism	116
4.5.3	Signaling Issues.....	117
4.5.4	Iterative Convergence Dynamics.....	117
4.6	Simulation Results	119
4.6.1	Convergence of the Game	120
4.6.2	Performance Evaluation of the One-Shot Game	121
4.6.3	Performance Evaluation in the Long Run	122
4.6.4	Price of Anarchy Evaluation	124
4.6.5	Impacts of Weighing Factors	124
4.6.6	System Performance with Increasing Loads.....	125
4.7	Concluding Remarks.....	127
	References	128
5	Other Applications of Potential Games in Communications and Networking	131
5.1	Applications of Exact Potential Games	131
5.1.1	Potential Games with Sum of Inverse SINRs as the Potential Functions	131
5.1.2	Potential Games Under Synthetic Symmetric Interference ...	136
5.1.3	Potential Games with Channel Capacity-Based Utility Functions	140
5.1.4	Potential Games for Players with Local Interactions in Cognitive Radio Networks.....	144
5.2	Applications of Pseudo-Potential Games	147
5.2.1	Strategic Complements and Substitutes	147
5.2.2	Convergence of Some Power Control Games with Interference Aggregation	149
5.2.3	A Pseudo-Potential Game Analysis for the Power Minimization Problem.....	155
5.3	Concluding Remarks.....	157
	References	157

Potential Game Theory

Applications in Radio Resource Allocation

Lă, Q.D.; Chew, Y.H.; Soong, B.-H.

2016, XVIII, 158 p. 49 illus., 25 illus. in color., Hardcover
