Preface

For nearly 50 years, there has been some interest in the cycles occurring as subgraphs of graphs. In 1971, Adrian Bondy introduced the idea of a *pancyclic* graph, one that contained cycles of every possible length. But from that time, the idea has been largely unexplored. Together with some of our colleagues, we have been looking at pancyclicity, and we decided it was time to write a book on the subject and related areas. It is our hope that students and researchers alike will find in this volume inspiration and ideas to facilitate their own work and shed further light on this fascinating topic.

We would like to express our thanks to some colleagues who have helped us in our endeavors, including Saad El-Zanati, Alison Marr, Alex Peterson, Nick Phillips, Christina Wahl, and Zach Walsh.

Our first draft was met with some very useful report from the referees, which we used to improve the book. We wish to thank them for their input.

We also wish to express our thanks to the staff of Springer and in particular to Razia Amzad for her help.
