

Contents

1	Introduction	1
1.1	Turbulent Dynamical Systems for Complex Systems: Basic Issues for Prediction, Uncertainty Quantification, and State Estimation	1
1.2	Detailed Structure and Energy Conservation Principles	3
2	Prototype Examples of Complex Turbulent Dynamical Systems	5
2.1	Turbulent Dynamical Systems for Complex Geophysical Flows: One-Layer Model	5
2.2	The L-96 Model as a Turbulent Dynamical System	7
2.3	Statistical Triad Models, the Building Blocks of Complex Turbulent Dynamical Systems	8
2.4	More Rich Examples of Complex Turbulent Dynamical Systems	10
2.4.1	Quantitative Models	11
2.4.2	Qualitative Models	11
3	The Mathematical Theory of Turbulent Dynamical Systems	13
3.1	Nontrivial Turbulent Dynamical Systems with a Gaussian Invariant Measure	14
3.2	Exact Equations for the Mean and Covariance of the Fluctuations	15
3.2.1	Turbulent Dynamical Systems with Non-Gaussian Statistical Steady States and Nontrivial Third-Order Moments	16
3.2.2	Statistical Dynamics in the L-96 Model and Statistical Energy Conservation	17
3.2.3	One-Layer Geophysical Model as a Turbulent Dynamical System	19

3.3	A Statistical Energy Conservation Principle for Turbulent Dynamical Systems	22
3.3.1	Details About Deterministic Triad Energy Conservation Symmetry	24
3.3.2	A Generalized Statistical Energy Identity	30
3.3.3	Enhanced Dissipation of the Statistical Mean Energy, the Statistical Energy Principle, and “Eddy Viscosity”	36
3.3.4	Stochastic Lyapunov Functions for One-Layer Turbulent Geophysical Flows	38
3.4	Geometric Ergodicity for Turbulent Dynamical Systems	39
4	Statistical Prediction and UQ for Turbulent Dynamical Systems . .	43
4.1	A Brief Introduction	43
4.1.1	Low-Order Truncation Methods for UQ and Their Limitations	43
4.1.2	The Gaussian Closure Method for Statistical Prediction . .	44
4.1.3	A Fundamental Limitation of the Gaussian Closure Method	45
4.2	A Mathematical Strategy for Imperfect Model Selection, Calibration, and Accurate Prediction: Blending Information Theory and Statistical Response Theory	46
4.2.1	Imperfect Model Selection, Empirical Information Theory, and Information Barriers	46
4.2.2	Linear Statistical Response and Fluctuation-Dissipation Theorem for Turbulent Dynamical Systems	48
4.2.3	The Calibration and Training Phase Combining Information Theory and Kicked Statistical Response Theory	51
4.2.4	Low-Order Models Illustrating Model Selection, Calibration, and Prediction with UQ	53
4.3	Improving Statistical Prediction and UQ in Complex Turbulent Dynamical Systems by Blending Information Theory and Kicked Statistical Response Theory	55
4.3.1	Models with Consistent Equilibrium Single Point Statistics and Information Barriers	57
4.3.2	Models with Consistent Unperturbed Equilibrium Statistics for Each Mode	57
4.3.3	Calibration and Training Phase	59
4.3.4	Testing Imperfect Model Prediction Skill and UQ with Different Forced Perturbations	59
4.3.5	Reduced-Order Modeling for Complex Turbulent Dynamical Systems	62

5 State Estimation, Data Assimilation, or Filtering for Complex Turbulent Dynamical Systems	65
5.1 Filtering Noisy Lagrangian Tracers for Random Fluid Flows	66
5.2 State Estimation for Nonlinear Turbulent Dynamical Systems Through Hidden Conditional Gaussian Statistics	67
5.2.1 Examples and Applications of Filtering Turbulent Dynamical Systems as Conditional Gaussian Systems	68
5.3 Finite Ensemble Kalman Filters (EnKF): Applied Practice Mathematical Theory, and New Phenomena	72
5.3.1 EnKF and ESRF Formulation	73
5.3.2 Catastrophic Filter Divergence	74
5.3.3 Rigorous Examples of Catastrophic Filter Divergence	75
5.3.4 Rigorous Nonlinear Stability and Geometric Ergodicity for Finite Ensemble Kalman Filters	75
5.4 Mathematical Strategies and Algorithms for Multi-scale Data Assimilation	76
5.4.1 Conceptual Dynamical Models for Turbulence and Superparameterization	77
5.4.2 Blended Particle Methods with Adaptive Subspaces for Filtering Turbulent Dynamical Systems	83
5.4.3 Extremely Efficient Multi-scale Filtering Algorithms: SPEKF and Dynamic Stochastic Superresolution (DSS)	83
References	85
