Contents

1 Introduction: Macraes Mine as an Orogenic Gold Deposit 1
1.1 Orogenic Gold Deposits 1
1.2 Alluvial Gold and the Otago Goldfield 2
1.3 Macraes Deposit Exploration and Mining History 3
1.4 The Modern Macraes Mine 5
References 6

2 Regional Geological Setting of the Otago Schist 7
2.1 Mesozoic Accretion 7
2.2 Otago Schist Lithology and Structure 8
2.3 Uplift, Exhumation, and Extension 10
2.4 Hyde-Macraes Shear Zone 11
2.5 Mesozoic Geochronology 12
2.6 Cenozoic Geological History of Macraes Area 15
2.7 Absence of Syn-mineralisation Magmatism 17
References 17

3 Structure and Lithology 19
3.1 Large Scale Structure 19
3.2 Unmineralised Rock Types 20
3.3 Mineralised Rock Types 24
3.4 Structure Within the Hyde-Macraes Shear Zone 26
3.5 Hangingwall Shear 28
References 31

4 Mineralised Structures 33
4.1 Mineralised Flat Veins 33
4.2 Mineralised Laminated Veins 35
4.3 Mineralised Shears 37
4.4 Syn-mineralisation Deformation of Veins 38

4.5 Formation of Laminated Veins . . . 42
4.6 Evolving Rheological Contrasts . . . 43
4.7 Cataclasite . . . 45
References . . . 46

5 Mineralogy and Paragenesis . . . 47
5.1 Hydrothermal Alteration Halo . . . 47
5.2 Early Stages of Structural and Mineralogical Paragenesis . . . 49
5.3 Non-metallic Mineral Phase Equilibria . . . 51
5.4 Metallic Mineralogy . . . 56
5.5 Gold . . . 59
5.6 Scheelite . . . 59
References . . . 61

6 Geochemistry of the Macraes Gold Deposit . . . 63
6.1 Major Element Variations . . . 63
6.2 Trace Elements . . . 65
6.3 Carbon and Sulphur . . . 67
6.4 Arsenic, Antimony and Tungsten . . . 69
6.5 Gold Grades and Distribution . . . 69
References . . . 73

7 Fluid Inclusions and Isotopic Signatures . . . 75
7.1 Fluid Inclusion Compositions . . . 75
7.2 Fluid Inclusion Water Stable Isotopes . . . 76
7.3 Fluid Inclusion Noble Gases . . . 79
7.4 Calcite Stable Isotopes . . . 79
7.5 Rock Isotopic Signatures . . . 80
References . . . 83

8 Graphite and Shear Zone Evolution . . . 85
8.1 Graphite in the Otago Schist Belt . . . 85
8.2 Mineralogical Characteristics of Graphitic Material . . . 87
8.3 Chemical Relationships Between Graphite and Gold Mineralisation . . . 89
8.3.1 Physical Relationships Between Graphite and Gold Mineralisation . . . 92
8.3.2 Geophysical Signature of Graphite . . . 93
8.3.3 Regional Graphitic Shear Zone Evolution . . . 94
References . . . 95

9 Genesis of Macraes as a Metamorphogenic Gold Deposit . . . 97
9.1 Regional Metamorphic Mobilisation of Metals . . . 97
9.2 Mineral Sources of Metals . . . 98
9.3 Early Cretaceous Orogenic Reconstruction . . . 99

9.4 Modern Analogues for Orogenic Gold Mineralisation Systems . . . 101
9.4.1 Analogues Around the World . . . 101
9.4.2 Southern Alps and Macraes Style Mineralisation . . . 102
9.4.3 Mineralisation Styles that Formed Shallower Than Macraes . . . 103
References . . . 105

10 Mining, Processing and Environment at Macraes . . . 107
10.1 Macraes Mine System . . . 107
10.2 Lithological Controls on Gold Recovery . . . 108
10.3 Pressure Oxidation . . . 110
10.4 Mine Tailings . . . 112
10.5 Environmental Context of Orogenic Gold Mines . . . 115
References . . . 117

11 Conclusions: Key Controls on Making of a World Class Deposit . . . 119
11.1 A World Class Orogenic Gold Deposit at Macraes . . . 119
11.2 Disseminated Gold Ensured Continuity of Mineralised Rock for Mining . . . 120
11.3 Regional Scale Source of Metals and Fluids in Host Schist Belt . . . 121
11.3.1 Mobilisation of Metals During Prograde Metamorphism . . . 121
11.3.2 Synchroneity of Metamorphism and Mineralisation . . . 122
11.4 Regional Scale Structural Focusing of Hydrothermal Fluid Flow . . . 122
11.4.1 Development of a Focused Shear Zone from More Pervasive Ductile Folding . . . 122
11.4.2 Enhancement of the Shear Zone by Hydrothermal Graphite . . . 123
11.5 Late Metamorphic Fluid Flow Caused Replacement Reactions . . . 123
11.5.1 Grain Boundary Fluid Flow Facilitated Retrogressive Alteration . . . 123
11.5.2 Continuous Fluid Flow in Micaceous Schists . . . 123
11.5.3 Episodic Fluid Flow in Fractured Competent Rocks . . . 124
11.5.4 Mineralisation Was Dominated by Replacement Reactions . . . 124

11.6 Subtle Lithological Variations Enhanced Mineralisation Locally 124
11.6.1 Anastomosing Micaceous Shears Host Most Gold. 124
11.6.2 Enhancement of Competency Contrasts by Hydrothermal Alteration 125
11.6.3 Local Stress Switching Facilitated Emplacement of Laminated Veins 125
11.7 Footprint of the Shear Zone Extends to >500 m. 125
11.7.1 Geochemical Footprint Is Dominated by Arsenic 125
11.7.2 Structural Footprint Is Dominated by Late Metamorphic Shears 126
11.7.3 Subtle Mineralogical Alteration Forms the Largest Footprint 127
11.7.4 Principal Geophysical Footprint Is Electrical Resistivity (Conductivity) 127
