Contents

1 The Windows of Susceptibility to Breast Cancer 1
1.1 Introduction 1
1.2 Risk Factor and Etiological Agents 2
1.3 The Concept of the Windows of Susceptibility to Carcinogenesis 5
1.4 The Windows of Susceptibility Apply to Human Breast Cancer 6
1.5 Effect of Hormones on Breast Cancer 9
1.6 Hormones as Carcinogens 9
1.7 Role of Breast Development and Cancer 10
1.8 Fertility and Breast Cancer Risk 12
1.9 Conclusions 13
References 14

2 The So Called Pre-Neoplastic Lesions and Carcinoma In Situ 21
2.1 Introduction 21
2.2 The So Called Pre-neoplastic Lesions 21
2.2.1 Ductal Hyperplasia 22
2.2.2 Lobular Hyperplasia 25
2.2.3 Atypical Ductal and Lobular Hyperplasia 25
2.3 The Histopathology of DCIS 29
2.3.1 Comedocarcinoma 30
2.3.2 Papillary Carcinoma in Situ 33
2.3.3 Solid Form of DCIS 34
2.3.4 Cribriform Carcinoma In Situ 34
2.3.5 Micropapillary Carcinoma In Situ 37
2.3.6 Other Forms of DCIS 38
2.4 Lobular Carcinoma In Situ (lClS) 38
2.5 Differential Diagnosis 43
References 43

3 The Pathobiology of the Breast Cancer Invasive Process 47
3.1 Introduction 47
3.2 Epithelial Mesenchymal Transition (EMT) 47
3.3 A Human Breast Cancer Cell Model of EMT 49
3.4 Other Factors Involved in the EMT 71
3.5 Conclusions 74
References 75

4 The Invasive Breast Cancer Types 79
4.1 Introduction 79
4.2 The Invasive Cancer Subtypes 79
4.2.1 Invasive Ductal Carcinoma No Otherwise Specified (NOS) 80
4.2.2 Invasive Cribriform Carcinoma 92
4.2.3 Mucinous Carcinoma 92
4.2.4 Tubular Carcinoma 96
4.2.5 Medullary Carcinoma 96
4.2.6 Invasive Papillary Carcinoma 96
4.2.7 Apocrine Carcinoma 96
4.2.8 Juvenile (Secretory) Carcinoma 98
4.2.9 Carcinomas with Neuroendocrine Features 100
4.2.10 Metaplastic Carcinoma 100
4.2.11 Inflammatory Carcinoma 101
4.2.12 Paget's Disease 102
4.2.13 Invasive Lobular Carcinoma 102
4.2.14 Mixed Ductal and Lobular Carcinoma 103
4.3 Microinvasive Breast Carcinoma 106
References 107

5 The Molecular Basis of Breast Cancer Subtypes 111
5.1 Introduction 111
5.2 Initial Genomic Classification 111
5.3 Extended Classifications: Molecular Subtypes 112
5.4 The Molecular Taxonomic Breast Cancer International Consortium (METABRIC) Classification 114
5.5 Genomic Classification Based on the Normal Cell Subtype 114
References 116

6 Stem Cells in Breast Cancer 117
6.1 Introduction 117
6.2 Cell Markers for Identifying the Stem Cell in the Mammary Gland 118
6.3 Estrogen Receptor as a Marker of Stem Cells in the Mammary Gland 120
6.4 MCF10F Cells Behave as a Stem Cell In Vitro 121
6.5 The MCF-10F in Estrogen Induced Carcinogenesis 123

6.6 The Evidence for the Role of Stem Cells in the Pregnancy Preventive Effect During Carcinogenesis 124
6.7 Isolation of the Stem Cells from the Rat Mammary Gland 126
6.8 Role of the Mammary Gland Stem Cell in the Prevention of Breast Cancer 128
References 129

7 The Mechanisms of Breast Cancer Metastasis 135
7.1 Introduction 135
7.2 Route of Metastasis 135
7.3 The Mechanism of Metastasis 136
7.4 The Lymphatic Vessels as a Path for Metastatic Dissemination 137
7.5 The Concept of Stem Cells and Metastasis 139
7.6 Role of Circulating Tumor Cells in Breast Cancer Metastasis 140
7.7 Metastasis of Breast Cancer to Specific Sites 141
7.8 Role of P53 and Metastasis 141
7.9 Problems with the Treatment of Metastasis 142
References 143

8 How to Build Up Adequate Prognostic Markers in the Molecular Biology Context of Breast Cancer 149
8.1 Introduction 149
8.2 Tumor Grading 150
8.3 Tumor Grading and Prognosis of Breast Cancer 151
8.4 Characteristics of the Primary Tumor, Such as ER Status, Tumor Size, and Histologic Grade, and Lymph Node Status at the Time of Surgery Served Significantly to Predict the Outcome of the Disease with Regard to Both Recurrence and Patient Survival 159
8.5 ER and PR as Biomarkers of Prognosis 166
8.6 Role of HER2 in Breast Cancer Diagnosis and Treatment 169
8.7 Evaluation of KI67 173
8.8 Molecular Profiling of Breast Cancer 174
8.9 General Considerations 175
References 176

9 Preclincial Models for Studying Breast Cancer 183
9.1 Introduction 183
9.2 Xenotransplantation 183
9.2.1 Xenografts for Testing the Tumorigenicity of Chemically Transformed Cells 186
9.2.2 The Oncogene C-HA-RAS Induces a Tumorigenic Phenotype in Human Breast Epithelial Cells 187
9.2.3 Tumorigenicity of 17-β–Estradiol Transformed Human Breast Epithelial Cells 188

9.3 The Labeling of Cancer Cells for an In Vivo Imaging System..... 188
9.3.1 A Model for Triple Negative Breast Cancer..... 191
9.4 Development of XtMCF and LmMCF Cell Lines..... 192
9.4.1 Molecular Characterization of XtMCF and LmMCF Cells..... 194
9.4.2 XtMCF and LmMCF Cells Are Differed from bsMCF-luc Cells in Migration, Solid Masses Formation, and Colony Formation Capacity..... 195
9.4.3 XtMCF and LmMCF Cells Are Highly Tumorigenic and Metastatic In Vivo..... 196
9.4.4 Classification of Xenografts and Lung Metastases Formed by XtMCF and LmMCF Cells..... 198
9.4.5 XtMCF and LmMCF Cells Present $CD24^{weak}/CD44^{+}/EpCAM^{+}$ Cancer Stem Cells Properties, EGF-Like Domain of EpCAM Is Cleaved Off..... 199
9.4.6 Relevance of the Triple Negative Breast Cancer Model..... 202
References..... 205

10 Biological Basis of Breast Cancer Prevention..... 211
10.1 Introduction..... 211
10.2 Pregnancy as a Physiological Process That Prevent Breast Cancer..... 211
10.3 Breast Development and Differentiation as the Biological Clue in Cancer Prevention..... 215
10.4 Basis of the Dual Effect of Late Pregnancy in the Increase Risk of Breast Cancer..... 219
10.5 Current Strategies in Breast Cancer Prevention..... 221
10.5.1 Experimental Data Supporting the New Strategy in Prevention..... 222
10.5.2 Clinical Studies Supporting the New Strategy in Prevention..... 224
10.5.3 Pregnancy and HCG Induce Permanent Genomic Imprinting or a Specific Signature of Protection..... 224
10.6 Developing a Prevention Clinical Trial Using HCG..... 225
10.7 Summary and Conclusions..... 228
References..... 229
