1	The Fluid Dynamics Adventure, from Newton to Stokes via Cauchy, Euler, Navier, Poisson, and Fourier	1
1.1	From Newton’s Fundamental Equation to the Cauchy Stress Principle and the Macroscopic Equations of Continuum Mechanics	1
1.2	Euler Non-viscous Equations and Navier Viscous Incompressible Equations	5
1.2.1	Euler Non-viscous Case	5
1.2.2	Navier Viscous Incompressible Case	12
1.3	Stokes’ Concept of Fluidity: Cauchy-Poisson and Fourier Constitutive Laws	15
1.3.1	Stokes’ Four Postulates	16
1.3.2	Cauchy-Poisson Law for the Cauchy Stress Tensor	17
1.3.3	Fourier Law for the Heat Flux Vector	18
1.4	Some Remarks	18
	References	26

Part I Classical Analytical-Asymptotics Newtonian NSF Fluid Dynamics

2	Formulation of Some NSF Unsteady Initial-Boundary Value Problems	29
2.1	The Case of a Thermally Perfect Gas: Typical NSF Equations . . .	30
2.2	The Case of an Expansible Liquid	31
2.3	Navier-Stokes (NS) Barotropic Compressible Equations	32
2.4	The Case of Nonlinear Acoustics	33
2.5	Initial-Boundary Value Problem for the Typical NSF Equations . . .	35
2.6	The Rotating Earth and Its Atmosphere as a Continuum	37
2.6.1	The Rotating Earth	38
2.6.2	The Atmosphere as a Continuum	40
2.6.3	Shallow Boussinesq Equations	42
2.6.4	Deep Equations “à la Zeytounian”	44

2.7	Complementary Remarks	45
	References	53
3	A Basic Postulate and Some Key Steps of the RAM Approach	55
3.1	The Basic Postulate of the RAM Approach	57
3.2	Typical Dimensionless NSF Problem and Reduced Parameters	58
3.3	Some Key Steps in the RAM Approach. The Deconstruction Process	65
3.4	The Case of Dimensionless Equations: In Spherical Coordinates—For Atmospheric Motions and Some Reduced Approximate Working Models	69
3.4.1	The NSF Generalized Atmospheric System of Equations	71
3.4.2	Hydrostatic Equations Emerging from the Limiting Process (3.10a and 3.10b) with δ_0 Fixed	73
3.4.3	Kibel Primitive Equations	74
3.4.4	Unsteady Adjustment to Hydrostatic Balance, According to <i>Guiraud and Zeytounian (1982)</i>	77
	References	79
4	Some Concluding Remarks About Part I	81
4.1	An Another Point of View Concerning the Dimensionless Equations	82
4.2	The Singular Nature of Fluid Dynamics	83
4.3	Unsteady Fluid Flows	86
4.4	Some Arguments Regarding the Boussinesq Equations	89
4.5	The Ubiquitous Small Parameters	91
4.6	A Guide for Classification	91
	References	93
Part II Deconstruction/RAM/Simulation Working Models and Their Classification		
5	Models Emerging from the Full NSF Problem via the RAM Approach	97
5.1	Structuralism and Deconstruction	98
5.2	Origins and Classification of a Family of Working Models Emerging from the NSF Problem. Figures 5.1, 5.2, 5.3, 5.4 and 5.5	100
5.3	Some Remarks	107
	Reference	108
6	Key Applications of the RAM Deconstruction Approach	109
6.1	The Unsteady High Reynolds Number Case ($Re \gg 1$), and Fig. 6.1	111
6.2	Unsteady Low Mach Number Case ($M \ll 1$), and Fig. 6.2	118
6.2.1	Navier-Fourier Limit Equations	119
6.2.2	Equations of Acoustics	121

6.3	Meteo-fluid Dynamics Models, and Fig. 6.3	123
6.4	The Three Significant Models of the Bénard Problem and Figs. 6.4 and 6.5	125
7	Some Concluding Remarks About Part II	133
7.1	Low Reynolds Number Case	133
7.2	Low Mach Number Case	133
7.3	Triple-Deck Model	134
7.4	Couette-Taylor Problem	136
7.5	Meteo-Fluid Dynamics	137
7.6	Some Complementary Remarks	139
	Reference	140

Part III Miscellaneous: Various Fluid Dynamics Workings Models

8	Some Applications of the RAM Approach During the Years 1974–2014	143
8.1	Introduction	143
8.1.1	Outer Euler limit	144
8.1.2	Intermediate Prandtl limit	144
8.1.3	Lower Viscous Limit	146
8.1.4	Interaction Between the BL and the LVL	147
8.2	Turbomachinery Homogenized Flows	148
8.2.1	A New Formulation	149
8.2.2	Deconstruction via Asymptotics	150
8.2.3	The Guiraud-Zeytounian Working Model (G-Z 1971)	152
8.2.4	Some Final Remarks	152
8.3	Asymptotic Modelling of Rolled-Up Vortex Sheets	154
8.3.1	Some Preliminary Comments	154
8.3.2	Double Scale Structure	156
8.3.3	Taking Advantage of (8.15b,c) in Order to Solve the System (8.15d) with (8.15e) and (8.15f)	157
8.3.4	Dynamical Condition on the Sheet	158
8.3.5	Vortex Sheets and Related Flow Structure	159
8.4	Long Nonlinear Surface Waves on Water and Soliton	160
8.4.1	Dynamics: An Overview	160
8.4.2	Pivotal Dimensionless Problem and the 2D Single Equation à la Boussinesq for Long Waves in Shallow Water	161
8.4.3	Solitary and Cnoidal Waves	162
8.4.4	KdV and KP Equations for Weakly Nonlinear Long Waves in Shallow Water	163
8.4.5	Nonlinear Schrödinger (NLS) Equations and Schrödinger-Poisson (NLS-P) Equations	166
8.4.6	Some Final Remarks	168

8.5	Some Singular Aspects of the Blasius BL Problem Asymptotics of the Blasius BL Steady Incompressible 2D Problem	169
8.5.1	Formulation of a Steady Compressible 2D Viscous Blasius BL Problem	170
8.5.2	Limit Euler (Outer) Equations for $(M_\infty)^2 \rightarrow 0$, with x and y Fixed	171
8.5.3	Limit Prandtl (Inner) Equations for $(M_\infty)^2 \rightarrow 0$, with x and $\eta = y/(M_\infty)^2$ Fixed	171
8.5.4	Flow Due to Displacement Thickness	172
8.5.5	Limit BL 2D Steady Equations Due to a Slight Compressibility Effect	172
8.6	A Theory for Lee Waves Downstream of a Mountain	174
8.6.1	2D Steady Model Equations for Lee Waves	174
8.6.2	Isochoric Case	175
8.6.3	Boussinesq Case	176
8.6.4	From the Isochoric Case to the Boussinesq Case	177
8.6.5	Some Results Concerning the Problem (8.44b)–(8.44c)	177
8.6.6	Models for Steady 2D Non-viscous Lee Waves in a Baroclinic Compressible Troposphere	181
8.6.7	Four Limiting Cases	186
8.7	A Model Problem for a Local Thermal Spot Effect	187
8.7.1	Dimensionless Local Problem	187
8.7.2	Triple Deck Structure	189
8.7.3	Analysis of the Three Regions	190
8.8	Flow of a Thin Film Over a Rotating Disk	193
8.8.1	A Mathematical Formulation	195
8.8.2	The Reduced Initial Boundary-Value Problem à la von Karman	196
8.8.3	Dimensionless RAM Approach	196
8.8.4	Outer Long Time Scale Limit: $Re \rightarrow 0$ with τ and ζ Fixed Zero-Order Outer Problem	197
8.8.5	First-Order Outer Problem	198
8.8.6	Inner Short Time Scale Analysis	198
8.8.7	Zero-Order Local Short Time Scale Problem	198
8.8.8	Complementary Remarks	199
8.9	The KZK–Parabolic Single Model Equation in Nonlinear Acoustics	200
8.9.1	The RAM Approach	201
8.9.2	Leading Order System for U_0 in the Simplistic Tentative Expansion (8.78f)	202
8.9.3	Second-Order System for U_1	203
8.9.4	The Compatibility–Non-Secularity Condition	204
8.9.5	KZK Equation	204
	References	205

9	Some Concluding Remarks about Part III	207
9.1	RAM Approach	207
9.2	Hydrodynamic Stability Theory	208
9.3	Bénard Thermal Convection	209
9.4	Anelastic (Deep) Equations	209
9.5	Small-Mach-Number Time-Dependent NSF Models	213
9.6	Analysis of Through-Flow Equations	215
	References	217
	Epilogue	219
	Index	223

Challenges in Fluid Dynamics

A New Approach

Zeytounian, R.K.

2017, XXVI, 230 p. 38 illus., Hardcover

ISBN: 978-3-319-31618-5
