## Part I Introductory Section

|                                                                                         |    |
|-----------------------------------------------------------------------------------------|----|
| <b>1 Electrochemical Power Sources</b> . . . . .                                        | 3  |
| 1.1 Glossary and Quantities Characterizing Batteries . . . . .                          | 5  |
| 1.2 Secondary Batteries . . . . .                                                       | 7  |
| 1.2.1 The Lead-Acid Battery . . . . .                                                   | 7  |
| 1.2.2 The Nickel-Cadmium Battery . . . . .                                              | 8  |
| 1.2.3 The Nickel-Metal Hydride Battery . . . . .                                        | 9  |
| References . . . . .                                                                    | 11 |
| <b>2 Lithium-Based Batteries</b> . . . . .                                              | 13 |
| 2.1 Brief History of Lithium Batteries . . . . .                                        | 14 |
| 2.2 The Lithium Batteries Today . . . . .                                               | 16 |
| 2.3 Characteristics of Li-Ion Batteries . . . . .                                       | 16 |
| 2.4 Working Principles of a Li-Ion Battery . . . . .                                    | 19 |
| 2.5 Li-Ion Batteries Components . . . . .                                               | 20 |
| 2.5.1 Anode Materials . . . . .                                                         | 20 |
| 2.5.2 Cathode Materials . . . . .                                                       | 25 |
| 2.5.3 Electrolytes . . . . .                                                            | 29 |
| 2.5.4 Separators . . . . .                                                              | 31 |
| 2.5.5 Binders . . . . .                                                                 | 32 |
| References . . . . .                                                                    | 32 |
| <b>3 Cellulose and Cellulose Derivatives in Li-Ion Batteries</b> . . . . .              | 39 |
| 3.1 New Concepts for Electrochemical Energy Storage Devices . . . . .                   | 42 |
| 3.1.1 Paper-Based Li-Ion Batteries . . . . .                                            | 43 |
| 3.1.2 The Use of Cellulose in Other Electrochemical Energy<br>Storage Devices . . . . . | 47 |
| References . . . . .                                                                    | 48 |

## Part II Experimental and Results Section

|          |                                                                                         |           |
|----------|-----------------------------------------------------------------------------------------|-----------|
| <b>4</b> | <b>Methods and Materials</b>                                                            | <b>55</b> |
| 4.1      | Materials                                                                               | 55        |
| 4.2      | Microfibrillated Cellulose Preparation                                                  | 57        |
| 4.3      | Composite Gel-Polymer Electrolyte (GPE) Preparation                                     | 57        |
| 4.4      | Cellulose Fibre Preparation                                                             | 60        |
| 4.5      | Thickness, Basis Weight and Retention Measurements                                      | 60        |
| 4.6      | SEM and FESEM Measurements                                                              | 60        |
| 4.7      | Electronic Conductivity Tests                                                           | 61        |
| 4.8      | Tensile Tests                                                                           | 62        |
| 4.9      | Electrochemical Tests                                                                   | 62        |
| 4.9.1    | Test Cells Assembly                                                                     | 62        |
| 4.9.2    | Galvanostatic Cycling Technique                                                         | 64        |
| 4.9.3    | Cyclic Voltammetry                                                                      | 64        |
| 4.9.4    | Ionic Conductivity Tests                                                                | 65        |
| 4.9.5    | Electrochemical Stability Measurements                                                  | 65        |
|          | References                                                                              | 66        |
| <b>5</b> | <b>Electrode Preparation Exploiting Filtration</b>                                      | <b>67</b> |
| 5.1      | Filtration Procedure                                                                    | 67        |
| 5.2      | Paper-Based Anode                                                                       | 69        |
| 5.3      | Paper-Based Cathode                                                                     | 72        |
| 5.4      | Complete All-Paper Cell                                                                 | 73        |
|          | References                                                                              | 75        |
| <b>6</b> | <b>Electrode Preparation Exploiting the Spray Coating Technique</b>                     | <b>77</b> |
| 6.1      | Paper Substrate and Preliminary Spray Coating                                           | 79        |
| 6.2      | Spray Coated Graphite Anode                                                             | 81        |
| 6.2.1    | Pilot-Scale Elaboration of FB-GP/CB/MFC Anodes                                          | 81        |
| 6.2.2    | Evaluation of the Electrochemical Properties of FB-GP/CB/MFC Anodes                     | 84        |
| 6.3      | Spray Coated LiFePO <sub>4</sub> Cathode                                                | 86        |
| 6.3.1    | Pilot-Scale Elaboration of FB-LiFePO <sub>4</sub> /CB/MFC Cathodes                      | 86        |
| 6.3.2    | Evaluation of the Electrochemical Properties of FB-LiFePO <sub>4</sub> /CB/MFC Cathodes | 88        |
| 6.4      | From Bi-Layered Electrodes to Complete All-Paper Li-Ion Cell                            | 89        |
| 6.5      | Conclusions                                                                             | 91        |
| 6.6      | Future Target and Prospective                                                           | 92        |
|          | References                                                                              | 93        |

|                                                                  |     |
