

Contents

Part I Probability theory

1	Basics of measure and probability theory	3
1.1	Limitations of the Riemann integral	4
1.2	Construction of the abstract integral	5
1.3	Main properties of the integral	15
1.4	Exercises	18
2	Distribution and conditional expectation	25
2.1	Radon–Nikodým theorem	26
2.2	Induced measure and distribution	27
2.3	Conditional expectation	29
2.4	Exercises	36
3	Limit theorems	41
3.1	Levels of convergence	42
3.2	Strong law of large numbers	47
3.3	Central limit theorem	51
3.4	Exercises	55

Part II Stochastic processes

4	Stochastic processes: general definition	59
5	Martingales	65
5.1	Optional stopping theorem	67
5.2	Martingale convergence theorem	74
5.3	Uniformly integrable and regular martingales	78
5.4	Reverse martingales and the law of large numbers	82
5.5	Doob's inequality and convergence in L^p	84
5.6	Exercises	87

6	Branching processes	93
6.1	Model description	94
6.2	Connection with martingales	94
6.3	Probability of survival	96
6.4	Mean and variance of the number of individuals	97
6.5	Exercises	99
7	Discrete-time Markov chains	101
7.1	Multi-step transition probabilities	102
7.2	Classification of states	104
7.3	Stationary distribution	108
7.4	Number of visits	111
7.5	Convergence to the stationary distribution	116
7.6	Exercises	124
8	Symmetric simple random walks	129
8.1	Infinite lattices	131
8.2	Electrical networks	134
8.3	The infinite collision property	135
8.4	Exercises	137
9	Poisson point and Poisson processes	141
9.1	Poisson point process and the Poisson distribution	142
9.2	Poisson process and the exponential distribution	144
9.3	Superposition and thinning	149
9.4	The conditioning property	154
9.5	Exercises	156
10	Continuous-time Markov chains	161
10.1	Definition and main assumptions	162
10.2	Connection with discrete-time Markov chains	164
10.3	Stationary distribution	168
10.4	Limiting behavior	173
10.5	Birth and death processes	180
10.6	Exercises	186
Part III Special models		
11	Logistic growth process	193
11.1	Model description	194
11.2	Long-term behavior	195
11.3	Quasi-stationary distribution	197
11.4	Time to extinction	198
11.5	Exercises	199

12 Wright–Fisher and Moran models	203
12.1 The binomial distribution	204
12.2 Probability of fixation	205
12.3 Diffusion approximation and time to absorption	209
12.4 Kingman’s coalescent	210
12.5 Moran model with selection	215
12.6 Exercises	216
13 Percolation models	219
13.1 Bond percolation in two dimensions	221
13.2 Monotonicity of the percolation probability	221
13.3 The critical phenomenon	223
13.4 Oriented site percolation in two dimensions	228
13.5 Critical value and contour argument	229
13.6 Exercises	232
14 Interacting particle systems	235
14.1 General framework	236
14.2 Invasion: the contact process	238
14.3 Competition: the voter model	239
14.4 Graphical representation	240
14.5 Numerical simulations in finite volume	241
14.6 Existence on infinite graphs	243
15 The contact process	245
15.1 Monotonicity and attractiveness	247
15.2 Self-duality	248
15.3 The critical value	251
15.4 Overview of the contact process	254
15.5 Exercises	256
16 The voter model	259
16.1 Duality with coalescing random walks	260
16.2 Clustering versus coexistence	261
16.3 Overview of the voter model	263
16.4 Exercises	266
17 Numerical simulations in C and Matlab	269
17.1 Classical models	270
17.2 Spatially implicit models	276
17.3 Percolation models	284
17.4 Interacting particle systems	288
References	295
Index	301

Stochastic Modeling

Lanchier, N.

2017, XIII, 303 p. 63 illus., 6 illus. in color., Softcover
