<b>1</b>	<b>Measures</b> . . . . .	<b>1</b>
1	Basic Properties of Measures . . . . .	1
2	Construction and Extension of Measures . . . . .	11
3	Lebesgue–Stieltjes Measures . . . . .	18
<b>2</b>	<b>Measurable Functions and Convergence.</b> . . . .	<b>23</b>
1	Mappings and $\sigma$ -Fields . . . . .	23
2	Measurable Functions . . . . .	26
3	Convergence . . . . .	31
4	Probability, RVs, and Convergence in Law . . . . .	35
5	Discussion of Sub $\sigma$ -Fields* . . . . .	37
<b>3</b>	<b>Integration</b> . . . . .	<b>39</b>
1	The Lebesgue Integral . . . . .	39
2	Fundamental Properties of Integrals . . . . .	42
3	Evaluating and Differentiating Integrals . . . . .	47
4	Inequalities . . . . .	49
5	Modes of Convergence . . . . .	55
<b>4</b>	<b>Derivatives via Signed Measures</b> . . . . .	<b>67</b>
0	Introduction . . . . .	67
1	Decomposition of Signed Measures . . . . .	68
2	The Radon–Nikodym Theorem . . . . .	73
3	Lebesgue’s Theorem . . . . .	77
4	The Fundamental Theorem of Calculus . . . . .	82
<b>5</b>	<b>Measures and Processes on Products</b> . . . . .	<b>89</b>
1	Finite-Dimensional Product Measures . . . . .	89
2	Random Vectors on $(\Omega, \mathcal{A}, P)$ . . . . .	96
3	Countably Infinite Product Probability Spaces <sup>o</sup> . . . . .	98
4	Random Elements and Processes on $(\Omega, \mathcal{A}, P)^o$ . . . . .	102
<b>6</b>	<b>Distribution and Quantile Functions</b> . . . . .	<b>107</b>
1	Character of Distribution Functions . . . . .	107
2	Properties of Distribution Functions . . . . .	110
3	The Quantile Transformation . . . . .	111
4	Integration by Parts Applied to Moments . . . . .	115
5	Important Statistical Quantities <sup>o</sup> . . . . .	119
6	Infinite Variance <sup>o</sup> . . . . .	123

<b>7</b>	<b>Independence and Conditional Distributions</b>	127
1	Independence	127
2	The Tail $\sigma$ -Field	131
3	Uncorrelated Random Variables	133
4	Basic Properties of Conditional Expectation <sup>o</sup>	134
5	Regular Conditional Probability*	143
<b>8</b>	<b>WLLN, SLLN, LIL, and Series</b>	149
0	Introduction	149
1	Borel–Cantelli and Kronecker lemmas	150
2	Truncation, WLLN, and Review of Inequalities	153
3	Maximal Inequalities and Symmetrization <sup>o</sup>	157
4	The Classical Laws of Large Numbers, LLNs	163
5	Applications of the Laws of Large Numbers	173
6	Law of the Iterated Logarithm	176
7	Strong Markov Property for Sums of IID RVs	179
8	Convergence of Series of Independent RVs	181
9	Martingales	186
10	Maximal Inequalities, Some with $\nearrow$ Boundaries <sup>o</sup>	187
<b>9</b>	<b>Characteristic Functions and Determining Classes</b>	193
1	Classical Convergence in Distribution	193
2	Determining Classes of Functions	198
3	Characteristic Functions, with Basic Results	201
4	Uniqueness and Inversion	206
5	The Continuity Theorem	210
6	Elementary Complex and Fourier Analysis	212
7	Esseen’s Lemma	218
8	Distributions on Grids*	221
9	Conditions for $\phi$ to Be a Characteristic Function*	223
<b>10</b>	<b>CLTs via Characteristic Functions</b>	225
0	Introduction	225
1	Basic Limit Theorems	226
2	Variations on the Classical CLT	231
3	Examples of Limiting Distributions <sup>o</sup>	238
4	Local Limit Theorems <sup>o</sup>	249
5	Normality Via $\tilde{W}$ insorization and $\tilde{T}$ runcation*	251
6	Independent Identically Distributed RVs*	261
7	A Converse of the Classical CLT*	264
8	Bootstrapping <sup>o</sup>	266
9	Bootstrapping with Slowly $\nearrow$ $\tilde{W}$ insorization*	268
<b>11</b>	<b>Infinitely Divisible and Stable Distributions<sup>o</sup></b>	271
1	Infinitely Divisible Distributions <sup>o</sup>	271
2	Stable Distributions <sup>o</sup>	278
3	Characterizing Stable Laws <sup>o</sup>	281
4	The Domain of Attraction of a Stable Law <sup>o</sup>	283
5	Gamma Approximation*	285
6	Edgeworth Expansions*	292

<b>12</b>	<b>Brownian Motion and Empirical Processes</b> . . . . .	297
1	Special Spaces . . . . .	297
2	Existence of Processes on $(C, \mathcal{C})$ and $(D, \mathcal{D})$ . . . . .	300
3	Brownian Motion and Brownian Bridge . . . . .	304
4	Stopping Times . . . . .	308
5	Strong Markov Property . . . . .	312
6	Embedding a RV in Brownian Motion . . . . .	315
7	Barrier Crossing Probabilities . . . . .	318
8	Embedding the Partial Sum Process <sup>o</sup> . . . . .	322
9	Other Properties of Brownian Motion <sup>o</sup> . . . . .	327
10	Various Empirical Process . . . . .	329
11	Inequalities for Various Empirical Processes <sup>o</sup> . . . . .	337
12	Applications <sup>o</sup> . . . . .	341
<b>13</b>	<b>Martingales</b> . . . . .	345
1	Basic Technicalities for Martingales . . . . .	345
2	Simple Optional Sampling Theorem . . . . .	350
3	The Submartingale Convergence Theorem . . . . .	351
4	Applications of the S-mg Convergence Theorem . . . . .	358
5	Decomposition of a Submartingale Sequence . . . . .	363
6	Optional Sampling . . . . .	367
7	Applications of Optional Sampling . . . . .	373
8	Introduction to Counting Process Martingales* . . . . .	375
9	CLTs for Dependent RVs <sup>o</sup> . . . . .	384
<b>14</b>	<b>Convergence in Law on Metric Spaces<sup>o</sup></b> . . . . .	387
1	Convergence in Distribution on Metric Spaces <sup>o</sup> . . . . .	387
2	Metrics for Convergence in Distribution <sup>o</sup> . . . . .	395
<b>15</b>	<b>Asymptotics via Empirical Processes</b> . . . . .	401

2	Slowly Varying Partial Variance When $\sigma^2 = \infty^o$ . . . . .	471
3	Specific Tail Relationships <sup>o</sup> . . . . .	478
4	Regularly Varying Functions* . . . . .	480

5	Some Winsorized Variance Comparisons*	483
6	Inequalities for Winsorized Quantile Functions*	490
<b>Remarks</b>		495
<b>References</b>		497
<b>Index</b>		501

**Comment:** Some sections and chapters (plus, some subsections, or theorems, or even a few particular paragraphs in a proof in Chapters 1–5, etc.) in the body of this text are marked with the  $^o$ -symbol. This is done if at most a moderate portion of the material therein will be required later, and if the decision on whether or not to include it can be postponed until the need or the desire arises. Such material should seldom be omitted entirely. The  $^*$ -symbol is used to indicate that at least some users of this text will be likely to omit these parts due to time constraints or choice. Hopefully, all instructors will have time for at least some of these sections. In either the  $^o$ -case or the  $^*$ -case, an instructor could be reasonably lax on the details while discussing the importance, and leaving the details to self study by students with the capacity and interest. (A  $^*$ -ed exercise is more substantial.)
