

Contents

1 Physico-Mathematical Models of Relaxing Molecular Gas Flows	1
1.1 Elements of Physical Kinetics	2
1.2 Systems of Equations of Relaxation Gas Dynamics	5
1.2.1 One-Temperature Models of the Flow	6
1.2.2 Two-Temperature Models of Relaxing Flows	9
1.2.3 Landau–Teller Equation	13
1.3 Parameters of Thermal Relaxation in Diatomic Gases	15
1.3.1 Bulk Viscosity Phenomenon	16
1.3.2 Rotational Relaxation	20
1.3.3 Vibrational Relaxation	28
1.4 Absorption of Acoustic Waves in the Relaxation Process	30
References	32
2 Linear Stability of Inviscid Plane-Parallel Flows of Vibrationally Excited Diatomic Gases	35
2.1 Equations of the Linear Stability Theory	36
2.2 Some General Necessary Conditions of Instability Growth	37
2.3 Growth Rates and Eigenfunctions of Unstable Inviscid Modes in a Free Shear Flow	43
2.3.1 Formulation of the Problem	43
2.3.2 Numerical Method and Results	45
References	49
3 Linear Stability of Supersonic Plane Couette Flow of Vibrationally Excited Gas	51
3.1 Statement of Problem and Basic Equations	53
3.2 Inviscid Stability Problem	58
3.2.1 Linear Equations for Inviscid Disturbances	58
3.2.2 Necessary Instability Conditions of Inviscid Modes	59

3.2.3	Numerical Collocation Method for Spectral Problem	64
3.2.4	Effect of Vibrational Relaxation on Growth of Second Acoustic Mode	67
3.3	Linear Stability of Supersonic Couette Flow at Finite Reynolds Numbers.	71
3.3.1	Numerical Calculations of Spectral Problem.	71
3.3.2	Structure of Spectra of Viscous Disturbances.	73
3.3.3	Neutral Stability Contours and Critical Reynolds Numbers.	77
	References	84
4	Asymptotic Theory of Neutral Linear Stability Contours in Plane Shear Flows of a Vibrationally Excited Gas	85
4.1	Asymptotic Solutions of Linear Stability Equations.	87
4.1.1	Asymptotics of Inviscid Solutions in Neighborhood of a Singular Point	88
4.1.2	Asymptotics of Viscous Solutions at High Reynolds Numbers.	90
4.2	Asymptotics of a Neutral Stability Curve of the Supersonic Couette Flow of a Vibrationally Excited Gas.	96
4.2.1	Secular Equation and Its Solution.	96
4.2.2	Asymptotics of the Critical Reynolds Numbers and Branches of the Neutral Stability Curve	103
4.2.3	Numerical Calculations of Secular Equation.	106
	References	109
5	Energy Theory of Nonlinear Stability of Plane Shear Flows of Thermally Nonequilibrium Gas.	111
5.1	Energy Stability Analysis of a Plane Compressible Flow. Effect of a Bulk Viscosity	113
5.1.1	Basic Equations and Functionals	113
5.1.2	Variational Problem. Quality Properties and Asymptotics of Low Critical Reynolds Numbers.	118
5.1.3	Results of Numerical Calculation of the Spectral Problem	127
5.2	Energy Stability Analysis of a Plane Vibrationally Excited Flow. Effect of a Vibrational Relaxation.	131
5.2.1	Energy Balance Equation of Total Disturbances.	131
5.2.2	Asymptotics of Low Critical Reynolds Numbers	136
5.2.3	Numerical Calculation of Low Critical Reynolds Numbers.	144
	References	151

6 Evolution of a Large-Scale Vortex in Shear Flow of a Relaxing Molecular Gas 153

6.1 Navier–Stokes Model Flow. Effect of Bulk Viscosity 154

6.1.1 Parametrization of a Model Flow 154

6.1.2 Basic Equations and Initial-Boundary Conditions. 156

6.1.3 Numerical Calculations of a Model Flow 160

6.2 Effect of a Vibrational Relaxation on Damping

Vortex Structure. 164

6.2.1 Basic Equations and Initial-Boundary Conditions. 164

6.2.2 Numerical Scheme and Results of Calculations 166

References 169

7 Dissipation of the Kelvin–Helmholts Waves in a Relaxing Molecular Gas 171

7.1 Nonlinear Evolution of the Kelvin–Helmholtz Instability in the Navie–Stokes Model 172

7.1.1 Formulation of the Problem 172

7.1.2 Calculation of Initial Perturbations 174

7.1.3 Numerical Calculations of the Evolution of Perturbations 176

7.1.4 Effect of Bulk Viscosity on Vorticity Kinematics. 177

7.1.5 Dissipation of the Kinetic Energy of Disturbances 182

7.2 Effect of a Vibrational Relaxation on the Kelvin–Helmholtz Instability 189

7.2.1 Formulation of Problem 189

7.2.2 Evolution of Disturbances in a Vibrationally Nonequilibrium Diatomic Gas 191
