

Contents

1	Introduction	1
1.1	A Symmetric Model Problem	2
1.1.1	Abstract Formulation of Poisson’s Equation	3
1.1.2	Discretization by the Finite Element Method (FEM)	4
1.1.3	Matrix Properties	6
1.1.4	Iterative Methods	9
1.1.5	Multigrid	10
1.1.6	Algebraic Multigrid (AMG)	15
1.2	A Nonsymmetric Model Problem	17
1.2.1	Model Problem with Adjoint	17
1.2.2	Weak Form	19
1.2.3	Discretization	21
	References	23
2	Theoretical Foundations	25
2.1	Sesquilinear Forms	26
2.2	Lax-Milgram Lemma	29
2.3	The “Energy” Norm and Dual Hilbert Space	30
2.4	Sectorial Forms	32
2.5	On Energy	35
	References	36
3	Form Absolute Value	37
3.1	Polar Decomposition of a Form	39
3.2	The Form Absolute Value	40
3.3	Positive Case	44
3.4	Existence and Uniqueness	48
3.4.1	Existence	49
3.4.2	Uniqueness	51

3.5	Examples	53
3.5.1	A 2×2 Matrix	53
3.5.2	1D Advection Diffusion	54
3.5.3	2D Advection Diffusion	56
3.6	Computation	57
3.6.1	General Case	58
3.6.2	Schur Decomposition	59
3.6.3	Newton Iteration.	60
	References	64
4	Convergence Theory	67
4.1	Symmetry.	69
4.2	Coarsening.	70
4.3	Hierarchical Decomposition	71
4.4	Biorthogonal Decomposition	76
4.5	Projected Smoother	77
4.6	Convergence Bounds	81
4.7	Symmetric Case	86
	References	89
5	Application to a New AMG Method	91
5.1	Independent Quality Measures	91
5.2	Coarsening.	94
5.3	Interpolation.	98
5.3.1	Interpolation Weights (Diagonal)	100
5.3.2	Interpolation Weights (Absolute Value)	104
5.3.3	Interpolation Support	106
5.4	Smoother	111
5.5	Numerical Results	113
	References	127
6	Conclusions	129
	References	131

Towards Robust Algebraic Multigrid Methods for
Nonsymmetric Problems

Lottes, J.

2017, X, 131 p. 21 illus., 15 illus. in color., Hardcover

ISBN: 978-3-319-56305-3
