Contents

1 Cellular Metabolism at the Systems Level 1
1.1 A Brief Introduction to Cellular Metabolism 2
1.1.1 Key Compounds 3
1.1.2 Biochemical Reactions 5
1.1.3 Biochemical Pathways 6
1.1.4 Classical Studies of Metabolism 8
1.2 Genome-Scale Models 13
1.2.1 Reconstructing Metabolism 13
1.2.2 The Systems-Level Approach 15
1.3 Aims and Objectives 18
1.4 Outline 19
References 20

2 Methods and Data 25
2.1 Structural Properties of Metabolic Networks as Complex Networks. 26
2.1.1 Basic Representation Frameworks 26
2.1.2 Degree Distribution 27
2.1.3 Average Path Length 29
2.1.4 Communities at the Mesoscale. 31
2.1.5 Large-Scale Connected Components. 32
2.1.6 Other Structural Properties of Complex Networks 35
2.1.7 Null Model Networks and Randomization Methods 35
2.2 Flux Balance Analysis 38
2.2.1 Formulation of the Biomass Reaction 42
2.2.2 Simulation of Different Environments. 42
2.2.3 Activity and Essentialify of Genes and Reactions. 44
2.2.4 Flux Variability Analysis 45

2.3 Model Organisms . . . 46
2.3.1 Escherichia coli . . . 47
2.3.2 Mycoplasma Pneumoniae . . . 47
2.3.3 Staphylococcus aureus . . . 48
References . . . 49

3 Structural Knockout Cascades in Metabolic Networks . . . 53
3.1 Cascading Failure Algorithm . . . 54
3.2 Impact of Reaction Failures . . . 55
3.2.1 Impact of Individual Reactions Failures . . . 55
3.2.2 Non-linear Effects Triggered by Pairs of Reactions Cascades . . . 60
3.3 Impact of Gene Knockouts in Metabolic Structure . . . 64
3.3.1 Metabolic Effects of Individual Mutations . . . 64
3.3.2 Metabolic Effects of Knocking Out Gene Co-expression Clusters . . . 66
3.4 Robustness Versus Regulation in Metabolic Networks . . . 69
3.5 Conclusions . . . 73
3.6 Summary . . . 74
References . . . 75

4 Effects of Reaction Knockouts on Steady States of Metabolism . . . 77
4.1 Activity and Essentiality of Single Reactions of *E. coli* Across Media . . . 79
4.1.1 Quantifying Activity and Essentiality . . . 79
4.1.2 Characterization of the Reactions . . . 80
4.2 SL Pairs and Plasticity and Redundancy of Metabolism . . . 87
4.2.1 Classification of SL Pairs . . . 88
4.2.2 Classification of SL Reactions Pairs into Plasticity and Redundancy . . . 89
4.2.3 Pathways Entanglement . . . 93
4.2.4 Sensitivity to Differences on Environmental Conditions . . . 94
4.3 Conclusions . . . 97
4.4 Summary . . . 98
References . . . 99

5 Detection of Evolution and Adaptation Fingerprints in Metabolic Networks . . . 101
5.1 Identification of the Disparity Backbones of Metabolic Networks . . . 102
5.2 Evolutionary Signatures in the Backbones of Metabolites . . . 105
5.3 The Metabolic Backbones of *E. Coli* Encode Its Short-Term Adaptation Capabilities . . . 107

5.4 Conclusions . . . 109
5.5 Summary . . . 111
References . . . 112

6 Assessing FBA Optimal States in the Feasible Flux Phenotypic Space . . . 115
6.1 Optimal Growth Is Eccentric with Respect to the Full FFP Space . . . 116
6.2 The FFP Space Gives a Standard to Calibrate the Deviation of Optimal Phenotypes from Experimental Observations . . . 121
6.3 The High-Biomass Production Region of the FFP Space Displays Aerobic Fermentation in Minimal Medium with Unlimited Oxygen Uptake . . . 123
6.4 Conclusions . . . 126
6.5 Summary . . . 127
References . . . 128

7 Conclusions . . . 131
References . . . 135

Appendix A: Kolmogorov–Smirnov Test . . . 137

Appendix B: Spearman's Rank Correlation Coefficient . . . 139

Appendix C: Point-Biserial Correlation Coefficient . . . 141

Appendix D: Disparity Filter . . . 143

Appendix E: Hit-And-Run Algorithm . . . 145

Appendix F: Principal Component Analysis . . . 149

A Network-Based Approach to Cell Metabolism
From Structure to Flux Balances
Güell, O.
2017, XX, 151 p. 49 illus., Hardcover
ISBN: 978-3-319-63999-4
