

Contents

1 Artificial Intelligence for Modeling and Control of Nonlinear Phenomena in Internal Combustion Engines	1
1.1 Neural Networks Architectures for Engine Applications	1
1.2 Use of ANNs for Modeling and Control of Internal Combustion Engines	5
1.2.1 Air–Fuel Ratio Prediction and Control	5
1.2.2 Use of Neural Networks to Predict Combustion Pressure Parameters	13
References	17
2 Non-interfering Diagnostics for the Study of Thermo-Fluid Dynamic Processes	21
2.1 Air Motion	22
2.2 Mixture Preparation	23
2.3 Combustion	26
2.4 Pollutants Formation	30
References	31
3 Modeling of Particle Size Distribution at the Exhaust of Internal Combustion Engines	33
3.1 Particulate Matter Emissions in Engines	34
3.2 Real-Time Prediction of Particle Sizing at the Exhaust of a Diesel Engine	40
References	44
4 Diagnosis and Control of Engine Combustion Using Vibration Signals	47
References	54

5	Use of in-Cylinder Pressure and Learning Circuits for Engine Modeling and Control	55
5.1	Cylinder Pressure Analysis and Extraction of Parameters for Engine Combustion Diagnosis and Control	56
5.2	Use of Learning Algorithms in Pressure-Based Engine Controls	59
5.3	Use of Combustion Pressure Signal for Cylinder Air Charge Estimation	59
5.4	Engine Knock Detection and Control Using in-Cylinder Pressure Measurement	64
	References	69
6	Identification and Compensation of Nonlinear Phenomena in Gasoline Direct Injection Process	73
	References	77
	Index	79

Nonlinear Systems and Circuits in Internal Combustion
Engines

Modeling and Control

Taglialatela-Scafati, F.; Lavorgna, M.; Mancaruso, E.;
Vaglieco, B.M.

2018, XII, 80 p. 60 illus., 49 illus. in color., Softcover

ISBN: 978-3-319-67139-0
