

Table 5.9: Length growth [$\text{cm} (\text{m}^2 \text{ root window area})^{-1} \text{ yr}^{-1}$], calculated biomass production [$\text{g dry weight m}^{-2} \text{ yr}^{-1}$], calculated carbon investment for biomass production [$\text{g C m}^{-2} \text{ yr}^{-1}$], and turnover index [$\text{root length yr}^{-1}$] of higher order lateral roots of different tree species at different European forest sites. Data are from root window observations, for calculations see text. Means and SE in parenthesis (n=5-16). Data within one row and tree species are not significantly different between sites when followed by the same letter (Tukey test). If necessary, data were \log_{10} or square root transformed before analysis to obtain normality.
